

\$PEACE

PEACE SOLDIERS Comprehensive Business Plan

- Investors and board version -

November 2025

Draft V1

Please note: Charts and visual diagrams will be incorporated into the report following final board approval.

Several sections of this report are structured to meet international audit and legal requirements. Many aspects will be further refined based on the board's final decisions, including potential legal actions.

Several sections of this report are structured to meet international audit and legal requirements. Many aspects will be further refined based on the board's final decisions, including potential legal actions.....	1
1. Executive Summary.....	7
1.1 The Why – Problem & Opportunity.....	7
1.2 The What – Solution & Product Stack.....	8
1.3 The Ask & Outcomes – What This Round Delivers.....	11
2. Problem & Opportunity.....	14
2.1. The problem.....	14
2.1.1 Unstable, short-term funding.....	14
2.1.2 Low transparency and broken feedback loops.....	15
2.1.3 Fragmentation and weak coordination.....	15
2.1.4 Incentives that do not reward verified impact.....	16
2.1.5 The untapped potential of Web3 capital and rails.....	17
2.2. The opportunity.....	17
2.2.1 From sporadic grants → to an on-chain endowment for peace.....	17
2.2.2 From opaque reporting → to standardized Human Impact Index (HII).....	18
2.2.3 From anonymous, plutocratic governance → to identity-bound, contribution-weighted governance.....	19
2.2.4 From fragmented initiatives → to a shared “Economy of Peace” layer.....	20
2.2.5 Why now.....	20
3. Vision & Strategy (will align with the board suggestions).....	21
3.1. Vision – The Economy of Peace.....	21
3.2. Strategic Angle – From NGO to Neutral Protocol Layer.....	22
3.3. Strategic Pillars.....	23
3.3.1. Treasury-First Impact.....	23
3.3.2. Web2.5 UX as the Front Door.....	24
3.3.3. Identity & HII-Centered Governance.....	24
3.3.4. NGO Network & Peace Hubs.....	25
3.3.5. Compliance-by-Design & Audit-Ready Governance.....	26
3.4. Strategy Over Time – From Design to Global Reference.....	26
4. Product & Ecosystem Overview.....	27
4.1. Product thesis – what we are actually building.....	27
4.2. System architecture – three-layer view.....	28
4.3. PS MiniApp & Web2.5 UX.....	29
4.3.1. Donor / user journey (MVP).....	29
4.3.2. NGO journey (MVP).....	30
4.3.3. Phased feature growth.....	31
4.4. Peace Passport – identity and reputation.....	31
4.5. NFT Layer – Genesis 10,000 & beyond.....	32
4.5.1. Genesis 10,000 Peace Soldier NFTs.....	32
4.5.2. Future NFT layers.....	33

4.6. Mission Engine & Human Impact Index (HII).....	33
4.6.1. Mission lifecycle – step by step.....	34
4.6.2. Illustrative mission – “Water access in East Africa”	35
4.7. Peace Store – impact-linked commerce.....	36
4.8. PS-DAO & governance interfaces.....	37
4.8.1. Governance design (high level).....	37
4.8.2. Governance user experience.....	38
4.9. Developer & partner integrations.....	38
4.9.1. Integration surfaces.....	38
4.9.2. Ecosystem roles.....	39
5. Market Landscape & Positioning.....	40
5.1. Market context – where Peace Soldiers sits.....	40
5.2. Target segments – who we serve first.....	41
5.3. Competitive landscape – who else is in the arena.....	43
5.4. Differentiation & positioning – why Peace Soldiers is distinct.....	44
5.5. Market size – TAM / SAM / SOM.....	46
5.6. Go-to-market wedge & expansion path.....	47
6. Business Model & Revenue.....	48
6.1. Business Model Summary.....	49
6.2. Revenue & Inflow Streams.....	50
6.2.1. Capital Inflows.....	51
6.2.2. Recurring Revenues.....	51
6.3. Cost Structure & Operating Philosophy.....	53
6.3.1. Core Cost Categories.....	53
6.3.2. Operating Principles.....	54
6.4. Capital Allocation & Flow of Funds.....	55
6.5. Illustrative Financial Scenarios (Conceptual).....	56
6.5.1. Conservative Scenario.....	56
6.5.2. Base Scenario.....	57
6.5.3. Upside Scenario.....	58
6.6. Alignment & Value Accrual.....	59
6.7. Similar ReFi Projects to Peace Soldiers.....	59
Key Trends in Similar Projects (2025).....	61
7. Token, Treasury & Financial Model.....	62
7.1. Design Objectives & Principles.....	63
7.2. \$PEACE Token – Role, Supply & Scarcity.....	64
7.2.1. Purpose & Functional Rights.....	64
7.2.2. Supply, Emissions & Deflation Levers.....	65
7.3. Distribution, Vesting & Liquidity.....	67
7.3.1. Allocation & Rationale.....	67
7.3.2. Vesting & Unlock Safety.....	69

7.4. Treasury Architecture & Yield Model.....	71
7.4.1. Size & Composition.....	71
7.4.2. Funding Logic & Compounding.....	73
7.5. Impact-Hedged Diversification & RWA (Phase 2–3).....	74
7.6. Contribution-Compounded Incentives.....	75
7.7. Mission Funding & Use of Proceeds.....	76
7.8. Scenario Ladder & “Peace Wealth Cycle”.....	77
7.9. Governance, Risk & Reporting (Summary).....	78
8. Go-To-Market & NGO Strategy.....	79
8.1. User Acquisition (Web2.5 Funnel).....	80
8.1.1. Funnel logic.....	80
8.1.2. Awareness.....	80
8.1.3. Engagement.....	81
8.1.4. Conversion.....	81
8.1.5. Retention.....	82
8.1.6. Cohort-specific tactics.....	83
8.2. Year 1 “Lighthouse” NGO Strategy.....	84
8.2.1. Regional focus.....	84
8.2.2. NGO selection & due diligence.....	85
8.2.3. Integration with HII & governance.....	86
8.2.4. Scaling beyond Year 1.....	86
8.3. Narrative-Driven Growth & Peace Ambassadors.....	87
8.3.1. Storytelling Syndicate.....	87
8.3.2. Peace Ambassadors.....	88
8.3.3. Fiat On-Ramps & High-Donor Strategy.....	89
8.4. Partnerships, Phasing & KPIs.....	90
8.4.1. Partnership tiers.....	90
8.4.2. Phasing.....	91
8.4.3. GTM & NGO KPIs.....	92
9. Roadmap & Milestones.....	93
9.1. Phase 1 – Prove the Rails (0–6 months).....	94
9.2. Phase 2 – Prove the Missions (≈6–12 months).....	97
9.3. Phase 3 – Prove the Economy (≈12–26 months).....	100
9.4. Phase 4 – Prove the Model to the World (26+ months).....	103
9.5. Dependencies, Risks & Flexibility.....	105
9.6. Governance of the Roadmap.....	106
10. Organization & Team.....	107
10.1. Operating Model.....	108
10.1.1. Lean Core, Rich Network.....	108
10.1.2. Roles Across the “Three Layers”.....	109
10.1.3. Collaboration with Peace Soldiers NGO.....	110

10.1.4. Progressive Decentralization of Operations.....	111
10.1.5. Work Culture & Ways of Working.....	112
10.2. Key Team Clusters.....	113
10.2.1. Product & Technology.....	113
10.2.2. Tokenomics & Treasury.....	113
10.2.3. NGO & Partnerships.....	114
10.2.4. Governance & DAO Operations.....	114
10.2.5. Legal, Compliance & Risk.....	115
10.2.6. Marketing, Communications & Community.....	115
10.2.7. QA, Security & External Audits.....	116
11. Risk, Compliance & Governance.....	116
11.1. Risk Philosophy.....	116
11.2. Key Risk Categories & Mitigations.....	117
11.2.1. Market & Liquidity Risk.....	117
11.2.2. Protocol & Technical Risk.....	118
11.2.3. Counterparty & RWA Risk.....	119
11.2.4. Regulatory & Legal Risk.....	120
11.2.5. Operational, NGO & Mission Risk.....	121
11.2.6. Governance, Reputational & ESG Risk.....	122
11.3. Compliance Architecture.....	123
11.3.1. Entity & Role Separation.....	123
11.3.2. KYC/AML, Sanctions & Data Protection.....	123
11.3.3. Token & TGE Compliance.....	124
11.4. Adaptive Shields – Triggers & Automated Responses.....	125
11.4.1. Shield Layers & Zones.....	125
11.4.2. Example Shields.....	126
11.5. Governance Structure & Accountability.....	128
11.5.1. Governance Layers.....	129
11.5.2. Transparency & Reporting.....	130
11.5.3. Incident Management & Escalation.....	130
12. Investment Ask & Use of Funds.....	132
12.1. Capital Raise – Structure & Targets.....	132
12.1.1. Funding Philosophy.....	132
12.1.2. Round Structure & Instruments.....	133
12.1.3. Treasury Size Scenarios (Conservative / Base / Upside).....	136
12.2. Use of Funds – Base Case Allocation.....	137
12.2.1. ~40% – Treasury for Missions & Yield Strategies.....	137
12.2.2. ~25% – Community, Growth & Incentives.....	138
12.2.3. ~15% – Liquidity & Listings (DEX/CEX).....	139
12.2.4. ~10% – Operations, Tech & Product.....	140
12.2.5. ~10% – Legal, Compliance, Audits, Security & Reserve.....	141

12.3. Phasing of Deployment.....	141
12.4. Governance of Capital & Investor Protections.....	143
12.5. Investor Takeaways.....	144
13. KPIs & Impact Measurement.....	146
13.1. Measurement Philosophy.....	146
13.2. KPI Stack – What We Measure.....	147
13.2.1. Impact KPIs (Mission & HII).....	147
13.2.2. Financial & Treasury KPIs.....	148
13.2.3. Ecosystem & Growth KPIs.....	149
13.2.4. Governance & Risk KPIs.....	149
13.3. Human Impact Index (HII) – Design & Use.....	150
13.3.1. Dimensions.....	150
13.3.2. Scoring Process.....	151
13.3.3. Example HII Scoring (Illustrative).....	152
13.4. Wealth Impact Ratio (WIR) – Linking Capital to People.....	153
13.4.1. Example WIR Calculation (Illustrative).....	153
13.5. From Metrics to Decisions.....	154
13.6. Data Infrastructure & Reporting.....	156
13.7. Iteration & Governance of Metrics.....	157
14. Closing & Impact Statement.....	158
14.1. What Success Looks Like.....	159
For people in fragile and underserved communities.....	159
For donors, users and communities worldwide.....	159
For capital and investors.....	160
For NGOs, practitioners and the peace ecosystem.....	160
14.2. Why Peace Soldiers Is Uniquely Positioned.....	160
14.3. Invitation to Join the Peace Wealth Cycle.....	162

1. Executive Summary

1.1 The Why – Problem & Opportunity

The peace and development sector sits in a structural paradox:

demand for peacebuilding and basic services is rising, but the systems that finance and coordinate this work are fragile, opaque and short-term.

On the ground, this looks like:

- **Unstable, crisis-driven funding**
After large crises, billions are pledged, but only a small fraction may reach local organizations in a timely, accountable way. High-profile cases (such as post-earthquake and post-conflict responses) have shown how donor fatigue, slow disbursement, and weak oversight can leave communities under-served while damaging trust in NGOs more broadly.
- **Low transparency and weak feedback loops**
Donors and even institutional funders typically see annual PDF reports, photos and anecdotes—not standardized, verifiable impact metrics. When impact is not measured in a comparable way, the system cannot learn from what works and what fails, and “good stories” often matter more than evidence.
- **Fragmented, under-coordinated actors**
Thousands of NGOs and initiatives compete for the same pools of attention and capital. They may duplicate efforts in some regions while leaving others under-served, because there is no neutral, shared “operating system” where missions, capital and data are coordinated.
- **Incentives that rarely reward verified impact**
Grants are usually paid upfront. As long as basic reporting requirements are met, there is limited economic consequence for under-performance, fraud or low efficiency—and little upside for exceptional performance. The rational behavior often becomes: do the minimum, stay compliant, move on.

At the same time, Web3 holds large pools of programmable capital and talent that could, in theory, help solve these issues:

- Crypto-native users and funds increasingly want impact-aligned exposure, not only speculative trades.
- Yet most capital still circulates in purely financial loops, with almost no access to vetted, real-world peace or development missions.

- Early “Web3 charity” experiments (simple donation dApps or one-off campaigns) proved user interest, but failed to create enduring treasuries, robust governance or a persistent mission pipeline.

There is no trusted bridge yet between:

stable, long-horizon peace financing on one side, and programmable Web3 capital on the other.

Thesis (one sentence)

Peace Soldiers is that bridge: a global, on-chain *Economy of Peace* where a transparent Web3 treasury funds HII-verified peace missions, sustained by yield instead of one-off donations.

To make this concrete, Peace Soldiers is designed to function like a university endowment for peace:

- The principal is treated as an inter-generational fund that must be preserved and grown prudently.
- Yield and revenues (not the principal) finance scholarships—in our case, peace and development missions.
- Governance, risk and reporting are structured so that donors, investors, NGOs and communities can see and influence how capital is used.

We leverage three core assets:

- NGO legacy and field experience – an existing track record (100k+ historical members and completed missions) that anchors the protocol in real-world credibility.
- Modern, low-friction infrastructure – a low-fee L1 and a Telegram MiniApp that make Web3 rails accessible to ordinary users and NGOs.
- A token + treasury model that ties value accrual to verifiable impact, not hype—through the Human Impact Index (HII), impact-hedged treasury design, and identity-bound governance.

1.2 The What – Solution & Product Stack

Peace Soldiers is not a single token or a donation page; it is a full-stack impact infrastructure designed for NGOs, donors, Web3 communities and institutional partners.

Core components

- PS MiniApp (Telegram Web2.5 entry)
Frictionless onboarding for non-crypto natives: users join via Telegram, get a wallet under the hood, browse live missions, and support them in under a minute—without needing prior Web3

knowledge.

- Peace Passport (non-transferable cNFT identity)
A “soulbound” identity that works like a non-transferable diploma: it records each user’s participation, HII score and governance eligibility. It cannot be sold or traded, which caps plutocracy and ties influence to real contribution, not just token balance.
- Genesis 10,000 Peace Soldier NFTs
The founding collection that powers early funding, core community and brand. Genesis holders are the symbolic “first wave” Peace Soldiers and may receive priority access to missions, governance roles and future drops.
- \$PEACE – contribution-compounded utility token
The coordination asset of the ecosystem, used for:
 - incentives and rewards (missions, governance, ecosystem contributions),
 - in-app utility (discounts, access tiers, payments in the Peace Store),
 - partial governance (within identity-based caps),
 - value accrual via buybacks and impact-linked demand, not pure yield-farming.
Emissions and buybacks can adapt to treasury health, avoiding unsustainable APR promises.
- Mission Engine & Human Impact Index (HII)
NGOs and local partners propose missions with clear objectives, budgets and KPIs. Missions are funded from the treasury, executed, and then evaluated through HII—a structured, comparable impact score. HII feeds:
 - user reputation (via Peace Passports),
 - future funding decisions (rewarding high-performing missions),
 - analytics and dashboards for donors, boards and regulators.
- Peace Store (impact-linked commerce)
A curated marketplace where ethical products, services and digital content are linked to specific missions. A share of revenues flows back to the treasury and/or mission pools, turning everyday purchases into recurring, mission-linked demand for \$PEACE.
- PS-DAO Governance Layer
A hybrid model where:

- Identity (Peace Passports) + capped token voting prevent single-whale capture.
- Treasury parameters, mission budgets and upgrades move progressively from the core team to the DAO.
- All decisions create on-chain receipts, making governance auditable for boards, investors and communities.
- Impact-hedged treasury (economic engine)
The economic core is a \$30–40M base-case on-chain treasury (scalable to \$50M+) with:
 - conservative ~9–10% net APY target via diversified strategies,
 - gradual allocation (up to ~30%) to regulated, impact-aligned RWAs (e.g. microfinance, sustainable bonds in peace regions),
 - mission funding primarily from yield + ecosystem revenues (Store, partnerships, NFTs), preserving and modestly growing principal.

Peace Wealth Cycle (simple view)

User engagement → missions funded → HII-verified impact → stronger brand & community → treasury and token value supported → reinvested yields → more missions → back to user engagement.

This is the flywheel that the entire business plan is designed to protect and scale.

Illustrative mission journey (board-level example)

To make the model tangible, consider a hypothetical youth reconciliation program in Jordan:

1. A local NGO proposes a mission via the PS platform: budget \$200k, KPIs around youth participation, conflict-resolution workshops, and school reintegration.
2. The mission is vetted by the NGO cluster and treasury/DAO councils, then approved with a staged funding plan (e.g. 30% upfront, 40% mid-way, 30% on verified completion).
3. The mission is listed in the MiniApp and highlighted in the Peace Store (e.g. co-branded products where 15% of revenues fund this mission).
4. Users claim Peace Passports, contribute small amounts, and optionally buy mission-linked products in the Store.

5. As the NGO executes, it submits evidence (photos, documents, attendance logs, third-party attestations) into the HII pipeline.
6. HII scores the mission (e.g. 82/100), which:
 - boosts the NGO's reputation and access to future funding,
 - improves the region's case for more missions,
 - feeds into dashboards for donors and investors.
7. Treasury yield + revenues replenish mission pools, so similar programs can be funded next year without depleting the core capital.

This story shows an investor, in one pass, how product, treasury, governance and impact come together.

1.3 The Ask & Outcomes – What This Round Delivers

Peace Soldiers is at the pre-launch stage:

- NGO legacy and field experience established.
- Web3 architecture completed (whitepaper, tokenomics & TGE master, DAO master, risk & governance design).
- Product scope defined (MiniApp, core contracts, HII pipeline, Peace Store, DAO interface).
- Initial NGO, ecosystem and launchpad pipelines under development.

Current raise (Seed / Strategic Round)

We are raising USD X–Y million (to be finalized with lead investors) as a seed / strategic round to fund Phases 1 and 2 ($\approx$ 12–18 months) and de-risk the model before a broader IDO / public launch. Capital will be used to:

- Ship the core product stack
 - Build and launch the MiniApp MVP (onboarding, Peace Passports, mission discovery).
 - Deploy core smart contracts:
 - \$PEACE token,

- Peace Passport,
 - Genesis 10,000 NFT collection,
 - treasury + basic governance modules.
- Prove the mission and HII loop
 - Execute 3–5 lighthouse missions with selected NGOs in high-priority regions (e.g. MENA, Africa, Eastern Europe – final list to be confirmed with partners).
 - Run these missions end-to-end through the HII pipeline, generating real impact data and stories for investors and the community.
- Establish governance, legal and risk foundations
 - Incorporate the legal structure (Foundation + NGO + OpCo) with a compliant, utility-token posture.
 - Complete first smart-contract and security audits.
 - Stand up basic DAO v1 with identity-bound voting and limited, clearly defined powers.
- Prepare for the public token event / IDO
 - Design TGE and vesting mechanics aligned with treasury safety and anti-dumping measures.
 - Coordinate with launchpads and Solana ecosystem partners for liquidity, market-making, and listings.
 - Target a \$30–40M base-case treasury over staged raises (private + public + NFT), scalable to \$50M+ in upside conditions.

What success looks like at the end of this round

For a board member or investor, success after this capital cycle is:

- From paper to protocol
 - A live MiniApp with active users and Peace Passports issued.
 - 3–5 completed lighthouse missions with published HII scores.

- A functioning treasury with transparent, board-level dashboards and scenario views.
- From idea to investable endowment
 - A clearly structured path to build and manage a \$30–40M base-case treasury (towards \$50M+ in upside scenarios).
 - Demonstrated ability to fund 15–20 missions per year from yield once ramped, with principal preserved.
- From NGO to neutral protocol
 - A hybrid governance model in production (team + councils + DAO), with identity-bound voting and on-chain receipts.
 - Legal and compliance posture that can withstand investor, audit and (over time) regulatory scrutiny.
- From narrative to evidence
 - Concrete, HII-backed mission case studies that can feed:
 - investor decks,
 - launchpad campaigns,
 - NGO and donor outreach,
 - and a long-term “Peace Wealth Cycle” story grounded in numbers, not only aspiration.

Investment lens:

This round positions Peace Soldiers as a category-defining “PeaceFi” protocol—a programmable endowment for peace missions—just before the space becomes crowded. It gives investors early access to a treasury-first, impact-linked Web3 infrastructure with NGO heritage, clear downside protections, and a credible path to scale.

2. Problem & Opportunity

2.1. The problem

The global peace and development sector sits in a structural paradox:

demand for peacebuilding and basic services is rising, but the systems that finance and coordinate this work are fragile, opaque and fragmented. Peace Soldiers' whitepaper calls this a “broken trust supply chain”: identities are easy to fake, proofs are weak, incentives decay over time, and reporting is often cosmetic rather than verifiable.

At a practical level, this shows up as four intertwined issues.

2.1.1 Unstable, short-term funding

NGO and peacebuilding budgets are heavily exposed to election cycles, media cycles and donor sentiment.

- A conflict or disaster dominates headlines, pledges surge for a few months, and then attention (and funding) collapses as the news cycle moves on.
- Local organizations are often left with half-built programs, unpaid staff and communities whose expectations were raised but not met.
- Even large, reputable NGOs routinely announce hiring freezes, program cuts or regional exits when donor fatigue sets in or when macro shocks hit (e.g. post-pandemic inflation, new crises drawing funds away from existing ones).

For field teams, “unstable funding” means:

- It is extremely hard to plan multi-year interventions.
- High-quality local talent leaves for more stable jobs.
- There is little room to invest in resilient local capacity (schools, clinics, mediation networks) that require long-term commitments.

In short, the current system constantly asks peacebuilders to do long-horizon work with short-term, unpredictable money.

2.1.2 Low transparency and broken feedback loops

For donors, philanthropists and even many institutional funders, visibility into what actually happens on the ground is limited.

- The dominant tools are still annual PDF reports, photos and anecdotes.
- Different NGOs use different metrics, making impact incomparable across projects and regions.
- When a mission underperforms, fails, or is delayed, there is rarely a shared, structured way to record that and learn from it.

This creates a broken feedback loop between capital and outcomes:

1. Donor sends money (often based on urgency and narrative).
2. NGO spends and reports via narrative, selective data and photos.
3. Data is not standardized; it is hard to verify independently.
4. No shared impact ledger exists, so lessons remain siloed.
5. Trust decays over time: donors cannot tell which missions or actors are consistently effective, so they either spread funds thinly or disengage.

Without a standardized, verifiable impact language, the system cannot “learn” from what works and systematically route more capital to high-performing actors.

2.1.3 Fragmentation and weak coordination

The peace and development landscape is extremely fragmented:

- Thousands of NGOs, foundations, grassroots initiatives and campaigns operate in parallel.
- Many of them compete for the same pools of donor attention, grants and media coverage.
- Coordination mechanisms (clusters, working groups, joint appeals) exist but often remain informal or issue-specific.

The consequences are:

- Duplication: multiple organizations running similar projects in the same area, each with its own overhead and branding.
- Blind spots: other regions or communities receive no support at all because they lack visibility or advocacy.

- High overhead and friction: every NGO must build its own reporting, fundraising and donor management stack from scratch.

There is currently no neutral, shared “operating system” where missions, capital and data meet in a structured way. As a result, even excellent projects struggle to scale beyond their original context, and proven models are not replicated systematically.

2.1.4 Incentives that do not reward verified impact

Today’s funding logic rarely ties rewards and long-term influence to verified human impact:

- Grants are typically paid upfront or in large tranches based on plans, not verified outcomes.
- As long as basic reporting boxes are ticked, there is limited economic consequence for underperformance or low efficiency.
- When a mission performs exceptionally well, the upside is mostly reputational; neither the NGO nor the local community participates in any form of long-term value creation.

This creates a subtle but powerful incentive structure:

- The equilibrium becomes “do the minimum” within constraints and move on to the next grant cycle.
- There is little structural reason to invest in better data, stronger governance or long-term community ownership, all of which require time and up-front cost.
- Donors do not share in any upside when projects dramatically exceed expectations, making peace and development feel like a perpetual cost center, not an investable, compounding effort.

In summary, the trust supply chain is broken:

- Trust is requested upfront,
- only partially repaid in the form of stories and selective metrics,
- and almost never compounded as shared, verifiable knowledge and long-term value.

2.1.5 The untapped potential of Web3 capital and rails

At the same time, the crypto/Web3 ecosystem holds very large pools of programmable capital and talent that could, in theory, help solve these problems—but today this potential is mostly unrealized.

- A significant share of on-chain capital sits in speculative or purely financial loops (trading, leverage, liquidity mining) with no direct route into real-world missions.
- Crypto-native users and funds increasingly want impact-aligned exposure (climate, social good, public goods), but struggle to find credible, auditable rails that connect their capital to peace or development outcomes.
- Early “Web3 charity” experiments—donation dApps, NFT campaigns, simple grant platforms—proved that there is demand, but most:
 - relied on one-off campaigns rather than an enduring treasury,
 - lacked standardized, comparable impact metrics,
 - and did not integrate identity, governance and mission pipelines into a single system.

In short:

Peace work needs stable, transparent, long-horizon financing and better coordination.

Web3 has programmable capital, identity and governance rails—but no trusted bridge between them yet.

2.2. The opportunity

The opportunity is to build that missing bridge: a neutral, global, on-chain treasury and mission layer for peace that connects capital, missions and communities in a transparent, incentive-aligned way.

Peace Soldiers is designed to occupy exactly this gap and turn the broken trust supply chain into a verified impact supply chain.

2.2.1 From sporadic grants → to an on-chain endowment for peace

Instead of burning donations each year and starting fundraising again from zero, Peace Soldiers aggregates capital into a professionally managed, diversified on-chain treasury and funds missions primarily from yield and ecosystem revenues, not principal.

- The base design targets a \$30–40M “Economy of Peace” treasury in the core scenario (scalable to \$50M+ in upside scenarios), with conservative ~9–10% net APY expectations.
- Yield strategies are diversified (stables, blue-chip staking, curated LP positions, regulated impact-aligned RWAs) and governed by clear risk rules.
- Mission budgets are drawn from recurring yields + marketplace and partnership revenues, while principal is actively protected and modestly grown.

This shifts peace funding from one-off, campaign-based appeals to an endowment-style model:

- Long-term missions become financeable.
- Talent and local capacity can be retained and developed.
- Donors and investors can see scenario-based projections of how many missions can be funded in each treasury band.

2.2.2 From opaque reporting → to standardized Human Impact Index (HII)

Peace Soldiers treats impact as a first-class, on-chain primitive, not just a narrative.

- Missions are proposed, funded, executed and then evaluated through a structured Human Impact Index (HII) framework.
- HII combines multiple dimensions (reach, depth, sustainability, efficiency, governance, verification) into a single, comparable score.
- Data and evidence (documents, media, third-party attestations) are routed through standardized pipelines, with on-chain references.

This creates:

- A shared language for NGOs, donors, investors and communities.
- The ability to route more capital to high-performing missions over time.
- A growing “impact graph” that can be analyzed, audited and used to design better future missions.

In other words, impact stops being an after-the-fact story and becomes a measurable input into treasury and governance decisions.

2.2.3 From anonymous, plutocratic governance → to identity-bound, contribution-weighted governance

Most token-based systems today risk whale capture and low accountability, as voting power is proportional to token balance, and real-world behavior has little impact.

Peace Soldiers inverts that:

- Each participant has a non-transferable Peace Passport (cNFT) that records missions supported, HII contribution, role (NGO, donor, verifier, builder) and governance eligibility.
- Voting power is capped per identity and can be positively influenced by real contributions (mission delivery, verification, ecosystem work), not only token holdings.
- Critical parameters (treasury risk settings, mission budget caps, major protocol upgrades) are governed via hybrid councils + DAO, with time-locks and emergency brakes.

This turns governance into a record of service, not just a record of spending power, and creates a moat around the protocol as identities and reputations accumulate.

2.2.4 From fragmented initiatives → to a shared “Economy of Peace” layer

Peace Soldiers is designed as a platform and protocol layer, not a single NGO or campaign:

- Any peace-focused NGO or initiative can propose missions and, over time, run their entire peace portfolio through the system.
- Users, donors and partners interact through a simple MiniApp interface (Telegram first, later other channels), abstracting away Web3 complexity.
- The combination of treasury, HII, identity and governance forms a shared infrastructure that multiple actors can plug into, rather than each organization building its own stack.

Over time, this enables:

- Peace Hubs in key regions: local clusters of NGOs, partners and communities coordinated through Peace Soldiers.
- Network effects as NGOs, donors, Web3 communities and brands converge on the same rails.
- A defensible, data-rich “Economy of Peace” that could not exist as a single NGO or a simple donation platform.

2.2.5 Why now

Several trends make this moment particularly attractive:

- Macro and institutional pressure: SDG funding gaps and geopolitical shocks are forcing governments, multilaterals and philanthropies to experiment with new models of financing and accountability.
- Maturing Web3 infrastructure: low-fee L1s, stablecoins, tokenized RWAs and identity primitives (passports, attestations) have reached a level where real-world use cases are viable.
- Behavioral shift in crypto capital: a growing segment of funds and communities want exposure to real-world impact with clear metrics, not just financial derivatives.

Peace Soldiers sits at the intersection of these forces:

It uses Web3's strengths (programmable capital, on-chain identity, transparent governance) to repair the broken trust supply chain of peace and development work—and to turn it into a scalable, measurable Economy of Peace.

3. Vision & Strategy (will align with the board suggestions)

3.1. Vision – The Economy of Peace

Our long-term vision is to build a global Economy of Peace:

a system where capital, missions and communities coordinate through an open, on-chain infrastructure – and where helping people is not a side activity, but a sustainable, self-reinforcing economic loop.

Today, peace and development work is financed mostly as charity:

- Money flows in,
- is spent on programs,
- And then it must be raised again from zero.

In the Peace Soldiers' vision, peace missions are financed more like a university endowment or large foundation:

- Capital is pooled into a transparent, diversified on-chain treasury.
- Yield and ecosystem revenues (from Stores, partnerships, and RWAs) fund HII-verified missions year after year.
- Principal is preserved and grown, creating a long-lived engine for peace instead of a series of one-time campaigns.

Over time, we see Peace Soldiers evolving along three arcs:

- From NGO → Protocol
 - Starting from a legacy NGO with real-world projects and over 100,000 historical members, Peace Soldiers transitions from a single-organization model to an open protocol that any peace-focused initiative can utilize.

- Missions, capital, and data all flow through shared rails, rather than each NGO building its own siloed system.
- From one project → global infrastructure
 - Peace Soldiers aims to become a reference infrastructure for “Web3 for Peace” – similar to how key DeFi protocols became standard building blocks for on-chain finance.
 - NGOs, DAOs, brands, and donors can use Peace Soldiers rails to launch and fund peace missions with shared identity (Peace Passport), metrics (HII,) and governance (PS-DAO).
- From charity → measurable Peace Economy
 - By 2030 and beyond, our ambition is that:
 - 100+ verified peace projects have been funded across multiple continents,
 - Regional Peace Hubs coordinate local missions and governance,
 - And a Peace Economy Index emerges as a recognized benchmark for how well capital is converted into human progress.

In this vision, \$PEACE is not just a token; it becomes a unit of coordination in this Peace Economy – Every transaction and vote expresses a choice for transparency, cooperation, and measurable impact.

3.2. Strategic Angle – From NGO to Neutral Protocol Layer

Peace Soldiers is not simply “tokenizing an NGO”.

We are building a neutral platform and protocol layer that any aligned actor can use.

- Any peace-focused NGO or initiative can:
 - Propose missions with clear budgets, KPIs and timelines;
 - Receive funding from the treasury in structured tranches;
 - Report impact through the HII framework, creating comparable data across regions and themes.
- Users (Web2 + Web3) access the system via the PS MiniApp on Telegram and web interfaces:
 - no need to understand wallets or gas at the start;
 - onboarding flows feel like familiar mobile apps, while the blockchain runs under the hood.

- Governance and allocations progressively shift from a founding team to a hybrid DAO:
 - identity-bound voting via Peace Passports,
 - capped token voting via \$PEACE,
 - And specialized councils for treasury, NGO vetting and risk.

The NGO origin provides:

- Credibility – years of field work and local partnerships,
- Narrative – a human story rooted in real communities,
- Pipeline – vetted NGOs and projects that can serve as the first “hero missions” of the protocol.

The Web3 layer provides:

- Programmable transparency – every grant, vote and treasury move is traceable.
- Identity and incentives – Peace Passports, HII, \$PEACE rewards, NFTs and roles.
- Scalability – once rails are in place, adding new missions, NGOs or regions is incremental, not a reinvention.

Strategically, Peace Soldiers positions itself:

- vs. classical NGOs:
 - as a partner that adds programmable funding, verifiable impact and long-term capital – not a competitor for grants.
- vs. Web3 charity dApps:
 - as a full-stack protocol (treasury, identity, HII, DAO, Store) aimed at a self-sustaining peace economy, not one-off donation campaigns.
- vs. generic DAOs:
 - as a DAO rooted in a real-world mission and NGO heritage, with governance tied to identity and impact rather than anonymous token whales.

3.3. Strategic Pillars

To turn this vision into an executable plan, Peace Soldiers is built on five strategic pillars.

3.3.1. Treasury-First Impact

We treat the treasury as a mission endowment, not a speculative pool.

- Focus on building a \$30–40M base-case treasury over staged raises (with upside to \$50–100M).
- Target ~9–10% net APY via conservative, diversified strategies, with up to ~30% in impact-aligned RWAs over time.
- Fund missions primarily from yield + ecosystem revenues, preserving and gradually growing principal.

This powers the Peace Wealth Cycle in simple terms:

1. Capital aggregates into a transparent treasury.
2. Treasury yield + ecosystem revenues fund HII-verified missions.
3. Successful missions strengthen the brand, data and demand for \$PEACE.
4. Stronger demand and reputation support the treasury and token.
5. The cycle repeats with more and better missions each year.

3.3.2. Web2.5 UX as the Front Door

We meet users where they already are.

- Telegram MiniApp as the core entry point (strong penetration in target regions).
- Embedded wallets and fiat on-ramps to hide complexity as much as regulation allows.
- Simple flows for mainstream users:
 - Join → claim Peace Passport → support missions → see results → gain HII and roles.

This Web2.5 strategy maximizes reach among non-crypto natives while preserving complete on-chain transparency for those who want to audit the system.

3.3.3. Identity & HII-Centered Governance

We design influence to follow verified contribution, not just capital.

- Peace Passport (cNFT) is a non-transferable identity that records:
 - missions supported,
 - HII contribution,

- governance tier and roles.
- HII is a standardized metric that feeds into:
 - Passport reputation and levels,
 - DAO eligibility,
 - mission evaluation and funding tiers.
- Token voting is capped and combined with identity, so power cannot be bought solely with \$PEACE.

This creates a governance moat:

Forking the code of Peace Soldiers is easy; forking the reputation graph, mission history, and HII data is hard.

3.3.4. NGO Network & Peace Hubs

We grow through lighthouse missions and regional clustering.

- Year 1 focus:
 - ~3 target regions (e.g., MENA, Africa, Eastern Europe – final list to be agreed with partners),
 - 2–4 vetted NGOs per region,
 - 1–2 “hero missions” per NGO with strong storytelling and HII data.
- Phases 3–4:
 - expansion to 20–30 active NGOs,
 - recurring missions per region,
 - formation of regional Peace Hubs with local councils and ambassadors.

Each region becomes a live proof-of-concept that:

- validates the rails (treasury + HII + governance),
- attracts more NGOs, donors, and institutional partners,

- And feeds real stories and metrics into investor and public narratives.

3.3.5. Compliance-by-Design & Audit-Ready Governance

From the start, we design for regulatory clarity and auditability.

- Clear utility-token stance for \$PEACE (in-app uses, no explicit profit/dividend promises).
- Foundation + NGO + OpCo structure with reputable KYC/AML processes and geographic restrictions where required.
- Smart-contract audits, treasury insurance options, bug bounties and quarterly reporting as standard, not afterthought.
- Scenario-triggered safeguards embedded into governance (e.g., volatility-based outflow controls, minimum reserve floors, liquidity and concentration guards).

This reduces legal and operational risk and makes Peace Soldiers legible to impact funds, regulated investors and large NGOs.

3.4. Strategy Over Time – From Design to Global Reference

The vision is implemented in phases, each with a clear strategic focus (detailed further in Section 9 – Roadmap & Milestones).

- Phase 1 – Prove the Rails (Months 1–6)
 - Deliver MiniApp MVP, Peace Passport, \$PEACE contracts, Genesis NFTs and initial treasury.
 - Execute private/public sales to secure a minimum viable treasury.
 - Objective: show that the technical and financial rails work end-to-end.
- Phase 2 – Prove the Missions (Months 7–10)
 - Run 3–5 pilot missions with HII v1 and DAO v1.
 - Capture data, refine UX, and publish early impact stories and dashboards.
 - Objective: prove that real-world missions can be funded, verified and governed through the system.

- Phase 3 – Prove the Economy (Months 10–26)
 - Scale the NGO network; grow mission volume towards 15–20 per year in the base scenario.
 - Launch the Peace Store, deepen DEX/CEX liquidity, and expand to hundreds of thousands of Peace Passports.
 - Objective: demonstrate a functioning Peace Wealth Cycle with recurring yield, missions and community governance.
- Phase 4 – Prove the Model to the World (Month 26+)
 - Establish regional Peace Hubs and broader alliances.
 - Expand cross-chain where relevant; launch advanced HII / AI-assisted verification features.
 - Work towards external recognition of a Peace Economy Index and position Peace Soldiers as the flagship model for “Web3 for Peace” worldwide.

Across all phases, the strategic loop remains constant:

[Design rails → run missions → measure and learn → open more to the DAO and ecosystem.](#)

This ensures that the Vision (Economy of Peace) and the Strategy (treasury-first, identity-based, Web2.5 UX, NGO network, compliant and auditable) stay tightly connected from day one through to global scale.

4. Product & Ecosystem Overview

4.1. Product thesis – what we are actually building

Peace Soldiers is not just a token, an NGO, or a donation page.

It is a **full-stack peace infrastructure** that connects three worlds on a single set of rails:

- People who want to help (donors, communities, Web3 users),
- Organizations that know how to help (NGOs, local partners, practitioners),
- Capital that is willing to help (treasuries, investors, brands, public contributors).

The product thesis is simple:

**If it becomes easy, transparent and rewarding to fund verifiable peace missions,
A new “Economy of Peace” can emerge – and sustain itself.**

To make this real, Peace Soldiers must:

1. **Feel like a familiar app** for ordinary users and NGOs
 - No need to understand wallets, gas, or DeFi jargon.
2. **Behave like an investable endowment** for capital
 - a clear treasury, risk framework, and predictable yield-to-impact connection.
3. **Act like a neutral protocol** for the ecosystem.
 - Any aligned NGO, DAO, or brand can plug into the rails without being “absorbed”.

From a product point of view, the core jobs we solve are:

- **For donors/users:**
“Show me missions I can trust and support in seconds, and keep me updated with evidence.”
- **For NGOs:**
“Give me a repeatable way to design, fund, and report missions with less overhead.”
- **For Web3 capital and investors:**
“Provide a clear, repeatable path from treasury yield to measurable human impact, with risk controls.”

The remainder of this section describes how the product stack fulfills these objectives.

4.2. System architecture – three-layer view

At a high level, Peace Soldiers is architected as **three tightly-connected layers**:

1. **User & Access Layer – “Web2.5 front door”**
 - PS MiniApp (Telegram first, then web and other surfaces)
 - Mission discovery, contribution flows, wallets under the hood
 - NGO and partner dashboards

2. **Coordination & Logic Layer – “missions, identity, governance”**

- Mission Registry and Mission Engine
- Human Impact Index (HII) scoring pipeline
- Peace Passport identity and reputation
- PS-DAO governance (councils + DAO + safeguards)

3. **Capital & Market Layer – “treasury, token, commerce”**

- On-chain treasury and yield strategies
- \$PEACE token, Genesis NFTs and future NFT layers
- Peace Store (impact-linked commerce)
- Liquidity on DEX/CEX, stablecoins, and impact-linked RWAs

The **Peace Wealth Cycle** connects these layers:

- People enter through the **User Layer**, interact with missions and the Store,
- Missions are designed, funded and evaluated in the **Coordination Layer**,
- Capital flows and yields are managed in the **Capital Layer**,
- Verified impact and data feed back into user reputation, treasury decisions, and brand growth. Completing a loop that can be repeated and scaled over time.

4.3. PS MiniApp & Web2.5 UX

The PS MiniApp serves as the primary **entry point** for most users and NGOs. It is deliberately built as a Web2.5 application:

familiar, mobile-first UI on top of on-chain infrastructure.

4.3.1. Donor / user journey (MVP)

A typical first-time user experience:

1. **Entry**

- Receives an invite or link in Telegram.
- Opens the MiniApp, sees a brief welcome message and a “Start Helping” button.

2. **Onboarding**

- Signs in with Telegram; a non-custodial or managed wallet is created silently in the background.
- Optional: chooses language and region preferences.

3. **Mission discovery**

- Lands on a curated list of “Lighthouse Missions” with clear titles, photos and simple tags (e.g. , “Education – MENA”, “Water – East Africa”).
- Each mission card shows: short description, funding status, basic KPIs, and HII score (if available).

4. **Support flow**

- Selects a mission, chooses an amount, and confirms payment (stablecoin, card via on-ramp, or \$PEACE depending on phase).
- If eligible, the user is prompted to **mint a Peace Passport** at the end of the flow.

5. **Follow-up and reputation**

- Over time, the user receives updates: mid-mission checkpoints, final HII score, and impact snapshots.
- Contribution history and mission scores are reflected in the Peace Passport.

The guiding principle:

From zero to supporting a verified mission in under a minute, without needing Web3 literacy.

4.3.2. NGO journey (MVP)

For NGOs and local partners, the MiniApp (plus web dashboard) offers:

1. Mission proposal wizard

- Step-by-step creation of a mission: objectives, target population, budget, risks, KPIs, and timeline.

2. Due diligence and review

- Upload of basic documents and references.
- Standard questions aligned with HII and risk frameworks.

3. Approval and funding plan

- Once vetted, missions receive a staged funding structure (e.g. tranches tied to milestones).

4. Execution support

- Simple tools to submit updates, evidence, and progress reports.
- Notifications for upcoming milestones and required documentation.

5. HII result and feedback

- After completion, the NGO sees the HII score, contributing factors, and recommendations for improvement.
- Strong performance increases their reputation and future funding chances.

4.3.3. Phased feature growth

- **Phase 1 (Rails):**
Mission listing, basic support flow, simple NGO mission wizard, Peace Passport minting.
- **Phase 2 (Missions):**
Deeper NGO dashboards, richer HII integration, more payment options, early governance views.
- **Phase 3 (Economy):**
Peace Store integration, brand campaigns, advanced analytics, stake-and-support features, treasury, and KPI dashboards for serious contributors.

4.4. Peace Passport – identity and reputation

The **Peace Passport** is a non-transferable cNFT that serves as the **identity spine** of the ecosystem.

It is best understood as a **digital, non-transferable student ID for peace work**:

- **Non-transferable:**
Once issued, it stays with the person. It cannot be sold, traded or delegated, which prevents “buying governance power”.
- **Evidence-linked:**
Each passport carries references to:
 - Missions supported or delivered,
 - HII scores associated with those missions,
 - Roles (donor, NGO, verifier, builder, council member).
- **Governance-aware:**
Governance rights (voting, proposal rights, council eligibility) are tied to the Passport plus capped token voting, not just raw token balance.
- **Reputation over time:**
Long-term participants accumulate a track record of contributions.

Over the years, this has become a defensible moat: new entrants cannot instantly replicate the role and trust of long-serving “Peace Soldiers”.

In practice, the Passport:

- Makes governance **human** (one identity, contribution-weighted influence),
- Reduces Sybil and whale capture risks,
- Allows the ecosystem to **reward verified service**, not only capital.

4.5. NFT Layer – Genesis 10,000 & beyond

The NFT layer is designed as the **culture and commitment layer** of Peace Soldiers.

4.5.1. Genesis 10,000 Peace Soldier NFTs

The Genesis collection:

- Represents the **founding wave** of Peace Soldiers.
- Provides an early **capital and community bootstrapping** mechanism for the treasury.
- Acts as an **access and recognition layer**, with utilities such as:
 - Priority access to early missions and campaigns,
 - Special roles in storytelling and community activities,
 - Potential enhanced governance touchpoints within defined caps.

Conceptually, these NFTs sit between culture and capital: they carry emotional meaning (stories, identity) while still being tied to concrete privileges.

4.5.2. Future NFT layers

Beyond Genesis, additional NFT layers can be introduced carefully over time:

- **Mission-linked NFTs:**
Commemorative tokens linked to specific missions (e.g. “Water for X Region 2027”), designed more for narrative and support than speculation.
- **Partner collections:**
Co-branded NFTs with NGOs, DAOs or brands, plugged into the same HII and treasury logic.

Any new NFT layer must respect three principles:

1. No dilution of Genesis symbolic status,
2. Straightforward utility and impact link,
3. No unsustainable “NFT farming” dynamics.

4.6. Mission Engine & Human Impact Index (HII)

The **Mission Engine** is the operational heart of Peace Soldiers. It turns the high-level vision into concrete, fundable, and measurable missions.

The **Human Impact Index (HII)** is the scoring framework that evaluates missions across dimensions such as reach, depth, sustainability, efficiency, governance and verification.

4.6.1. Mission lifecycle – step by step

1. Sourcing & design

- NGOs or partners submit mission ideas through the MiniApp/dashboard.
- They specify objectives, target communities, budget, risks, KPIs and timeline.

2. Screening & due diligence

- Basic checks: organization track record, local partners, legal constraints.
- Early risk grading (e.g. context risk, operational risk).

3. Structuring & approval

- Missions are structured into tranches (e.g. 30% upfront, 40% mid-way, 30% on verified completion) to align incentives.
- Treasury, NGO and risk councils review and approve within defined limits.
-

4. Funding & execution

- Approved missions are funded from dedicated pools (yield + revenues, not principal).
- NGOs execute on the ground, submitting periodic updates and evidence (including documents, photos, attendance logs, and third-party attestations).

5. HII scoring

- After defined checkpoints and completion, data is processed through the HII framework.
- The mission receives a score (e.g. 82/100) with breakdowns per dimension.

6. Feedback & consequences

- High-scoring missions:
 - Improve the NGO's reputation and future funding access,
 - Strengthen the case for similar missions in that region or theme.
- Poorly performing missions:
 - Trigger stricter requirements, reduced budgets or suspensions.

7. Data to dashboards

- HII results feed into dashboards for:
 - Donors and users (simple, story-driven views),
 - Boards and investors (aggregated analytics and risk views),
 - Regulators and auditors (evidence-linked trails).

8. Treasury feedback loop

- Mission performance feeds back into treasury and allocation decisions:
 - More capital for consistently high-performing mission types and NGOs,
 - Tighter thresholds or exits for low-performing segments.

4.6.2. Illustrative mission – “Water access in East Africa”

As a simple example:

- A local NGO proposes a **water access project** with:
 - Budget: \$150k,
 - KPIs: number of people with new safe water access, uptime of wells after 12 months, and local maintenance training.
- The mission has been approved in staged tranches and is listed in the MiniApp and Peace Store.
- Users can:
 - Contribute small amounts,
 - Purchase mission-linked products (e.g. coffee, merchandise) through the Store.
- At completion, the mission is scored with HII:
 - High reach and sustainability, medium efficiency, strong verification.

That single score and its breakdown are then reused across governance, treasury decisions, dashboards, and storytelling – making the mission part of a growing, comparable impact graph.

4.7. Peace Store – impact-linked commerce

The **Peace Store** extends Peace Soldiers into everyday life: it turns purchases into an ongoing **source of capital and narrative for missions**.

Core idea:

When someone buys from the Peace Store, they are not only purchasing a product – they are also helping fund a specific, verifiable mission.

Key elements:

- **Curated catalog**
 - Ethical products (e.g. coffee, apparel, crafts), digital goods, and services aligned with Peace Soldiers' values.
- **Mission-linked products**
 - Each product or collection is tied to one or more missions.

- Product pages show which mission benefits and how (e.g. “15% of net revenue supports Youth Peace Hubs in X region”).
- **Revenue routing**
 - A predefined share of revenues is allocated to the treasury and/or mission pools.
 - Over time, this becomes a meaningful recurring inflow that complements yields and donations.
- **\$PEACE integration**
 - \$PEACE may be used for discounts, access to special collections, or early access to limited drops, further linking token demand to real activity.
- **Brand and partner gateway**
 - Brands, creators and DAOs can plug in their products or campaigns via the Store, gaining a transparent, HII-backed impact channel instead of generic “charity promises”.

In the early phases, the Store focuses on **a few lighthouse categories** and partners where logistics and alignment are precise, then scales based on data and demand.

4.8. PS-DAO & governance interfaces

The **PS-DAO** governs how missions, treasury and protocol evolve over time.
The product challenge is to make governance **usable, accountable and safe**.

4.8.1. Governance design (high level)

- **Hybrid structure**
 - Councils (treasury, NGO, risk, tech) handle specialized decisions within caps.
 - The broader DAO (Passport + token holders) validates larger moves, parameter changes and upgrades.
- **Identity + token**
 - Voting power is composed of:
 - A base layer tied to the Peace Passport and contribution history,

- A capped token layer tied to \$PEACE holdings and staking.

- **Safeguards**

- Time-locks on major changes,
- Emergency “shields” for security or market events (aligned with Section 11),
- Clear incident and escalation flows.

4.8.2. Governance user experience

From a user interface point of view:

- **Proposals view**

- Simple cards for proposals: “Mission Batch Q3”, “Treasury Parameter Update”, “New Partner Onboarding”, etc.
- Each card shows summary, impact, risk notes and voting window.

- **Voting flow**

- Users see their combined voting weight (Passport + token stake within limits).
- One-tap choices (For / Against / Abstain) with optional rationale.

- **Receipts and history**

- After each vote, users see a record in their Passport and on-chain receipts.
- Long-term, this creates a verifiable “service record” for governance participants.

The objective is to make governance **as intuitive as voting in a well-designed app**, while preserving the seriousness required for treasury and mission decisions.

4.9. Developer & partner integrations

To become real infrastructure, Peace Soldiers needs to be **easy to build on**.

4.9.1. Integration surfaces

- **APIs and webhooks (conceptual)**

- Partners can fetch mission lists, funding status and HII scores to embed in their own apps, dashboards or campaigns.
- Webhooks for mission events (funded, completed, score published) enable automated actions on partner side.

- **Widgets and embeds**

- Simple “Support this mission” or “Impact badge” components that websites can embed.
- NGO sites, DAO frontends, media partners and creators can add Peace Soldiers actions without heavy integration.

- **Launchpad and CEX/DEX integrations**

- Launchpads and exchanges can reference Peace Soldiers data and KPIs in their listings or campaign pages, reinforcing the treasury-first, impact-linked narrative.

4.9.2. Ecosystem roles

The integration strategy supports multiple partner types:

- **NGOs and practitioners** – use PS rails instead of building their own.
- **DAOs and Web3 projects** – route part of their treasury or fees into Peace Soldiers missions with complete transparency.
- **Brands and creators** – run impact-linked campaigns via the Peace Store and mission registry.
- **Analysts and researchers** – access anonymized HII and WIR data over time, turning impact into a measurable field.

Over time, this makes Peace Soldiers **not just a product, but a shared peace infrastructure layer** that many actors can rely on.

5. Market Landscape & Positioning

This section explains where Peace Soldiers sits in the broader landscape of peacebuilding, development funding, Web3/ReFi, and impact-driven commerce – and why the project is well-positioned to become the reference platform for the “economy of peace”.

5.1. Market context – where Peace Soldiers sits

Peace Soldiers operates at the intersection of three large, historically disconnected domains:

1. Peace & development funding

- Governments, multilateral agencies, large NGOs and philanthropies collectively deploy very large sums every year into peacebuilding, humanitarian aid and development.
- Despite this, the “peace gap” and broader SDG funding gap remain massive. Funds are often channeled through long intermediaries, with limited transparency for citizens who care deeply about peace but feel distant from institutions.
- Traditional donors are under pressure to demonstrate measurable impact, not only inputs (budgets) and outputs (activities).

2. Web3 / ReFi & programmable capital

- Web3 and ReFi (“Regenerative Finance”) have introduced programmable treasuries, transparent on-chain accounting, and community-governed protocols that can route capital with high granularity.
- Most current ReFi projects focus on climate or carbon; very few offer a robust, peace-first, NGO-grade platform with identity, governance and treasury discipline designed in from day one.

3. Impact-aware citizens, consumers and investors

- A growing global segment of individuals – especially younger generations – wants their money, time and digital activity to reflect their values.
- They increasingly support brands, applications and tokens that prove real-world impact, not just speculative price action.

- This group is underserved by both traditional NGO channels (slow, opaque, often distant) and many Web3 projects (too technical, speculative, anonymous).

Peace Soldiers sits exactly where these three worlds overlap:

- **NGO-grade peace missions,**
- **on-chain programmable capital and governance, and**
- **a Web2.5 UX that ordinary people can actually use.**

The opportunity is to turn “peace support” from sporadic charity into a **continuous, measurable peace economy**.

5.2. Target segments – who we serve first

While the long-term ambition is global, the go-to-market strategy focuses on a clear set of priority segments.

1. NGO partners and peacebuilders (core supply side)

- Mid-sized, credible NGOs, foundations and community organisations with a track record in peacebuilding, reconciliation, education, women’s empowerment and related fields.
- Pain points: unstable funding, heavy reporting overhead, difficulty reaching new donors, and pressure to demonstrate impact.
- What Peace Soldiers offers:
 - Access to a mission funding platform with transparent disbursement and verification (HII).
 - Potential for multi-year, yield-backed funding instead of one-off grants.
 - A global community of peace supporters and a shared impact language.

2. Global citizens & grassroots supporters (retail “peace community”)

- Individuals who already follow peace, humanitarian or social justice causes, including the existing Peace Soldiers membership and diaspora communities.
- Pain points: distrust of where funds go, lack of feedback, fragmented donation experience.
- What Peace Soldiers offers:

- A simple MiniApp and Web2.5 interface where they can support missions, see evidence, and track their Peace Passport reputation.
- The option to earn and use \$PEACE in a broader peace economy (Store, missions, governance) rather than making “donations into a black box”.

3. **Crypto-native and ReFi participants**

- Web3 users, ReFi communities and Solana ecosystem participants who are comfortable with tokens, staking, LPs and DAOs.
- Pain points: lack of serious, well-governed impact protocols that combine long-term treasuries with real-world missions; over-supply of purely speculative projects.
- What Peace Soldiers offers:
 - A treasury-first, impact-backed economic model with conservative yields and a clear link between capital, HII and mission funding.
 - Identity-bound governance and impact metrics that can become reference standards in the ReFi x peace niche.

4. **Strategic capital providers (impact funds, Web3 funds, family offices)**

- Institutional or semi-institutional capital that already allocates to Web3, impact, or both.
- Pain points: difficulty finding projects that combine real-world impact, strong risk discipline, and scalable token economics.
- What Peace Soldiers offers:
 - Exposure to a diversified, impact-linked treasury with transparent governance and conservative assumptions.
 - A clear role in seeding the peace economy while maintaining professional standards on risk, compliance and reporting.

These segments form a **multi-sided market**: NGOs bring missions, citizens and crypto users bring participation and liquidity, and strategic capital anchors the treasury. Peace Soldiers is the coordination layer binding them into a single peace-focused economy.

5.3. Competitive landscape – who else is in the arena

Peace Soldiers does not operate in a vacuum. The broader landscape spans four main groups:

1. Traditional donation and crowdfunding platforms

- Examples include global crowdfunding sites, large international NGOs, and donor-advised fund platforms.
- Strengths: existing brand recognition, regulatory infrastructure and donor bases.
- Limitations:
 - Funding is often campaign-based, volatile and short-term.
 - Transparency is limited; donors rarely see clear impact metrics.
 - There is no programmable treasury or on-chain governance.

2. Web2 “impact” fintechs and charity platforms

- Applications that round up transactions into donations, or allocate a share of revenues to causes.
- Strengths: seamless UX, strong consumer narrative.
- Limitations: Funds are still routed through opaque backends, with limited real-time verification and community governance.

3. Web3 charity / impact platforms

- Protocols and DAOs enabling on-chain donations, impact pools or grant programs.
- Strengths: transparency of flows, composability with DeFi, early experimentation in ReFi.
- Limitations:
 - Many are campaign-first, not treasury-first.
 - Governance is often pure token-voting without robust identity or mission-level verification.
 - Peacebuilding as a dedicated vertical is largely underdeveloped compared to climate or generic “charity tokens”.

4. ReFi protocols and mission-focused DAOs

- Projects focused on regenerative finance, most notably around carbon and environmental assets.
- Strengths: proof that on-chain treasuries and impact-linked assets can attract serious capital.
- Limitations: very few provide a structured framework tailored to peace, conflict transformation and social cohesion; few are anchored in legacy NGOs with existing grassroots networks.

Within this landscape, Peace Soldiers is both complementary and differentiated:

- It can integrate with existing donation/charity platforms as an **on-chain peace treasury and verification layer**, not necessarily as a competitor.
 - It takes lessons from ReFi but applies them to a new, distinct vertical: **peace as a global public good**.
-

5.4. Differentiation & positioning – why Peace Soldiers is distinct

Peace Soldiers' positioning rests on a set of structural advantages:

1. Treasury-first design, not campaign-first

- Most donation platforms revolve around individual campaigns that start, end and then disappear.
- Peace Soldiers is built as a **permanent, on-chain mission endowment**: capital is pooled into a diversified treasury, and yield plus a disciplined share of principal are channelled into missions year after year.
- This mirrors how serious endowments fund scholarships or research—but applied to peacebuilding, with on-chain transparency.

2. Identity and HII at the core, not an afterthought

- The Peace Passport (soulbound cNFT) and Human Impact Index (HII) are not cosmetic features; they are central to governance and rewards.

- Reputation and decision-making power grow with verified contributions, not mere capital size.
- Missions are scored, compared and prioritised using a structured HII framework, creating a **shared language of impact** across the ecosystem.

3. **Web2.5 UX on top of serious Web3 rails**

- Most Web3 charity or ReFi experiments require users to handle wallets, seed phrases and DeFi flows upfront.
- Peace Soldiers utilizes a Mini-App and familiar messaging interfaces, allowing ordinary users to start contributing with minimal friction.
- Under the surface, the system operates on Solana and integrates with established infrastructure, providing the project with institutional-grade speed and cost efficiency.

4. **NGO legacy and peace specialization**

- The project is rooted in an existing peace-focused NGO with a large membership base and a proven track record in the real world.
- This gives Peace Soldiers a **credible mission pipeline**, field partners and governance culture that many purely crypto-native projects lack.
- The thematic focus on peace (rather than generic charity or climate alone) creates a clear, ownable vertical.

5. **Multi-sided peace economy, not just donations**

- Beyond donations and treasury yield, the Peace Store and broader ecosystem enable everyday economic activity (purchases, services, digital products) to fund missions.
- Over time, this creates a **flywheel**: more users and NGOs → more missions and Store activity → more yield and fees → more missions and stronger brand → more users and capital.

5.5. Market size – TAM / SAM / SOM

Exact numbers are detailed in supporting materials, but conceptually the opportunity can be framed as a funnel.

1. Total Addressable Market (TAM)

- At the broadest level, Peace Soldiers taps into:
 - Global peacebuilding, humanitarian and development funding (public, philanthropic, NGO, foundation).
 - Private charitable giving by individuals and corporations.
 - Conscious commerce and impact-linked spending where a share of revenue funds social causes.
- Together, this represents **hundreds of billions of dollars in annual flows**, and a multi-trillion funding gap relative to peace and SDG needs.

2. Serviceable Available Market (SAM)

- The portion realistically addressable by a digital, on-chain platform with NGO partnerships:
 - Digital donors and impact-conscious consumers reachable via mobile applications and online campaigns.
 - Web3 and ReFi capital actively seeking credible impact treasuries.
 - NGOs and peace organisations willing and able to integrate with an on-chain mission engine.

This narrows the focus to a significant but more realistic pool where Peace Soldiers' product, UX and partnerships are relevant.

3. Serviceable Obtainable Market (SOM) – initial beachhead

- The first 3–5 years focus on:
 - The existing Peace Soldiers member base and adjacent communities (MENA and diaspora).
 - A defined circle of early NGO partners willing to pilot HII-based missions.

- A curated group of Web3 funds, impact investors and ReFi projects that align with the treasury-first peace thesis.
- The immediate objective is not to capture a large percentage of the TAM, but to **establish Peace Soldiers as the reference platform** for on-chain peace missions, with a treasury in the tens of millions and a visible, high-quality mission portfolio.

Explaining the funnel in simple terms:

- **TAM:** all money and economic activity that could, in principle, support peace.
- **SAM:** the part that can practically flow through a digital, Web2.5 / Web3 platform.
- **SOM:** the specific wedge where Peace Soldiers can realistically win early and build a powerful brand and network effect.

5.6. Go-to-market wedge & expansion path

Peace Soldiers' market entry is deliberately staged, building from strong foundations rather than broad, unfocused reach.

1. Wedge: lighthouse missions and existing community

- Launch with 2–3 **lighthouse missions** in regions where the founding NGO and partners already operate, using the MiniApp, HII and treasury flows end-to-end.
- Activate the existing Peace Soldiers community and adjacent peace networks as the first cohort of passport holders, donors and early Store users.
- Use these missions to prove the full loop: treasury allocation → mission execution → HII scoring → narrative and reporting.

2. Layering in Web3 / ReFi and strategic capital

- In parallel, onboard a small group of **strategic investors and ReFi partners** who understand the model and can provide not just capital but credibility and distribution.
- Ensure that initial treasury construction, token distribution and governance design visibly meet the standards expected by serious Web3 participants.

3. **Expansion: peace hubs and partner networks**

- As lighthouse missions mature, expand into **regional peace hubs**: clusters of missions and NGOs in priority geographies where Peace Soldiers can become the default impact platform.
- Integrate the Peace Store with local and global merchants to connect everyday spending to these hubs.

4. **Scale: from platform to reference standard**

- Over time, move from “a platform that runs peace missions” to “**the reference infrastructure for peace economy treasuries and impact measurement**”.
- Encourage third-party developers, NGOs and even other institutions to build on top of the Human Impact Index, Peace Passport and treasury architecture, effectively turning Peace Soldiers into shared rails for peace-focused capital.

In summary, the market is large and fragmented, but the path to dominance is focused:

- Start with a narrow wedge where Peace Soldiers has structural advantages,
- Prove the model with real missions and real capital,
- Then expand outward until “peace on-chain” and “Peace Soldiers” are effectively synonyms.

6. **Business Model & Revenue**

Peace Soldiers’ business model is built around a simple premise:

Treat capital for peace like an endowment, not a donation box.

Instead of burning donations and restarting every year, the protocol aggregates capital into a transparent on-chain treasury, generates sustainable yield and ecosystem revenues, and funds missions primarily from that recurring income. The principal is preserved and grown over time, so the “engine of peace” becomes stronger with each cycle, rather than resetting to zero.

The model has three tightly connected layers:

1. **Treasury & Capital Inflows** – how capital enters and grows.

2. **Ecosystem Revenues** – how ongoing activity generates income.
3. **Allocation & Costs** – how funds are divided between missions, operations and reinvestment.

Together they power the **Peace Wealth Cycle** (described in more detail in Section 7 and Section 13):

Capital → Treasury → Yield & Revenues → Missions → HII-verified impact → Stronger brand & trust → More capital → Stronger treasury → More missions.

6.1. Business Model Summary

Who pays?

- **Initial investors and strategic backers** – seed/strategic round participants and later IDO buyers who provide the first layers of treasury capital.
\$PEACE BUSINESS PLAN
- **NFT buyers** – Genesis 10,000 Peace Soldier NFT holders and future NFT-style collections that fund the brand and community layer while adding to the treasury.
Peace Soldiers – Board _ Invest...
- **Users and brands in the Peace Store** – individuals and companies whose purchases and campaigns route a share of revenue into mission and treasury pools.
Peace Soldiers – Board _ Invest...
- **Impact-aligned partners and funds** – capital providers for RWA / Peace Bond structures who seek transparent, peace-linked yield.
Peace Soldiers – Board _ Invest...

Who benefits?

- **Beneficiaries & communities** – through funded, HII-scored peace and development missions.
Peace Soldiers – Board _ Invest...
- **NGOs & field partners** – via structured, repeatable funding and a reputational graph that rewards verified performance.
Peace Soldiers – Board _ Invest...

- **Token and NFT holders** – from a healthier ecosystem, stronger treasury and long-term \$PEACE utility and demand tied to real usage, not short-term speculation.
Peace Soldiers – Board _ Invest...
- **The protocol and DAO** – via compounding treasury strength, network effects and data (identity graph + HII).

How value is created (high-level flow)

1. **Capital is aggregated** into an on-chain treasury (seed/strategic round, IDO, NFT sales, partnerships).
Peace Soldiers – Board _ Invest...
2. **Treasury is allocated** into diversified yield strategies (crypto-native yield, staking, and—over time—impact-aligned RWAs).
Peace Soldiers – Board _ Invest...
3. **Yield + ecosystem revenues** fund missions and operations while preserving and gradually growing principal.
Peace Soldiers – Board _ Invest...
4. **Successful missions and sound governance** strengthen HII scores, trust and brand, which attract more capital, users, NGOs and partners.
Peace Soldiers – Board _ Invest...
5. **Demand for \$PEACE and ecosystem assets** grows as people need them to participate, govern and unlock benefits.

Conceptually, it behaves like a **university endowment for peace**:

- The “donated capital” (treasury) is preserved.
- **Yield and revenues** fund scholarships, which support missions.
- Reputation and performance attract more capital, which further strengthens the engine.

6.2. Revenue & Inflow Streams

Peace Soldiers combines **one-off capital inflows** (to build the treasury) with **recurring revenues** (to sustain missions and operations).

6.2.1. Capital Inflows

These inflows expand the **Peace Treasury** and are not expected to recur every year at the same scale:

- **Seed / Strategic Round**

- Targeted at smart capital (impact funds, Web3 VCs, strategic angels, aligned NGOs).
- Funds Phase 1–2 delivery (MiniApp MVP, core contracts, first missions, legal setup) and seeds an initial treasury base.
Peace Soldiers – Board _ Invest...

- **Public Token Launch / IDO**

- A carefully phased IDO and launch strategy targeting a **\$30–40M base-case treasury** over time, with upside to **\$50M+** if demand and partnerships allow.
Peace Soldiers – Board _ Invest...
- Designed to avoid oversizing the raise; capital must be matched by governance, legal readiness and NGO throughput (see Sections 7 and 12).

- **NFT & Digital Asset Sales**

- Genesis 10,000 Peace Soldier NFTs and later thematic collections (e.g., regional missions, Peace Hubs) allocate a portion of proceeds directly to treasury and mission pools.
Peace Soldiers – Board _ Invest...

- **Strategic Capital & RWA / Peace Bonds**

- Over Phases 2–3, part of the treasury can be deployed into or co-funded with **impact-linked RWA instruments** (microfinance pools, sustainable bonds, peace-region credit structures).
Peace Soldiers – Board _ Invest...
- In some cases, external capital may join specific Peace Bond structures where repayment and yield are linked to both financial performance and mission outcomes.

Capital inflows are **front-loaded** in the early years, then expected to become **opportunistic** (e.g., specific Peace Bond tranches, mission co-funding) rather than the main engine of growth.

6.2.2. Recurring Revenues

Recurring revenues are what make the model sustainable. They are designed to cover **missions and operations, while still allowing for** measured reinvestment into the treasury.

1. Treasury Yield

- Base architecture targets **~9–10% net APY** in the base scenario, via a diversified mix of:
Peace Soldiers – Board _ Invest...
 - ~40% in stablecoin yield strategies (conservative pools, overcollateralized lending, etc.).
 - ~40% in \$PEACE/SOL and related LP positions, with careful risk management.
 - ~15% in blue-chip staking (e.g., SOL and other major assets).
 - ~5% in operational cash buffers.
- Over time, up to **~30%** of the treasury may be allocated to **impact-aligned RWAs** (Peace Bonds, tokenized microfinance, and sustainable infrastructure in peace regions), once the necessary legal and partner frameworks are in place.
Peace Soldiers – Board _ Invest...

2. Peace Store Net Revenues

- The Peace Store acts as an **impact-linked commerce layer**:
 - Brands and creators list products or campaigns that support specific missions with a fixed share of revenue.
Peace Soldiers – Board _ Invest...
 - A portion of Store margin is directed to the treasury and mission pools, creating a **real-economy demand loop** for \$PEACE (discounts, access, loyalty mechanisms).

3. Protocol & Service Fees

- Modest, transparent fees on:
 - Certain mission flows (e.g., small coordination fees on large institutional or RWA-related missions).

- Specialized services (e.g., white-labeled HII analytics or infrastructure for aligned partners).
- These fees are designed to be **non-extractive** and may be partially rebated or redirected to mission grants and reserves.

4. NGO & Ecosystem Co-Funding

- Over time, large NGOs, development funds and corporate CSR programs may route capital through the Peace Soldiers rails, paying for access, tooling or reporting overlays rather than building their own infrastructure.

The target state is that most mission and operating budgets are funded from treasury yield + ecosystem revenues, not from continuous token sales or dilution.

6.3. Cost Structure & Operating Philosophy

6.3.1. Core Cost Categories

At a high level, Peace Soldiers' cost structure mirrors the **use-of-funds envelope** detailed in Section 12 (40/25/15/10/10):

1. Missions & NGO Support (Treasury-funded)

- Direct mission grants and tranches.
- NGO capacity-building, due diligence and field verification.

2. Community, Growth & Incentives

- MiniApp & Peace Passport growth programs.
 - Referral, quest and contribution rewards (non-ponzi, capped, impact-linked).
 - Peace Ambassadors and Storytelling Syndicate – turning missions into high-quality, global narratives.
- Peace Soldiers – Board _ Invest...

3. Operations, Tech & Product

- Core protocol engineering (Solana, smart contracts, MiniApp, HII engine, Store).
 - Product, UX, design and DevOps.
 - Core team compensation and essential operational overhead.
- Peace Soldiers – Board _ Invest...

4. **Liquidity & Listings (DEX/CEX)**

- Seeding and locking DEX liquidity for \$PEACE on major Solana DEXs.
- CEX listing costs and professional market-making mandates.
Peace Soldiers – Board _ Invest...

5. **Legal, Compliance, Audits, Security & Reserve**

- Legal structuring (Foundation + NGO + OpCo), ongoing advisory.
- Smart-contract audits, security reviews, bug bounties and (where viable) insurance.
- Regulatory and operational reserve buffers.
\$PEACE BUSINESS PLAN- Draft 1

6.3.2. **Operating Principles**

Several operating principles guide how these costs are managed:

- **Yield-First Discipline**

- Mission budgets grow primarily with sustainable yield and revenues, not with uncontrolled token emissions.

- **Coverage Months & Runway**

- Treasury allocation and scenario design maintain sufficient coverage months (operations + missions) so the protocol can absorb shocks without cutting essential programs abruptly.
\$PEACE BUSINESS PLAN- Draft 1

- **Mission Before Marketing (But Not Without Marketing)**

- Storytelling budgets are meaningful, but derived from real missions and data rather than hype.

- **No Ponzi Incentives**

- Incentives are capped, contribution-weighted and linked to HII and governance, not high-yield farming loops.

- **Lean Core, Rich Network**

- The internal team remains lean; much of the work is done by NGOs, partners, validators, ambassadors and community contributors, who are incentivized rather than fully internalized as fixed cost (see Section 10).

6.4. Capital Allocation & Flow of Funds

This subsection explains **how every dollar of capital is routed** once it enters the system.

1. Capital enters the Peace Treasury

- From rounds, IDO, NFTs, Store surpluses and partners.

2. Treasury allocates capital into target bands (as detailed in Section 7.4 and Section 12.2):

Peace Soldiers – Board _ Invest...

- Stablecoin strategies, LP positions, staking, and—over time—impact-aligned RWAs.

3. Yearly “available income” is calculated

Available income =

Net yield (after fees) + net ecosystem revenues – required risk & reserve contributions.

4. Available income is then split across three envelopes (proportions vary by scenario, but logic is stable):

Peace Soldiers – Board _ Invest...

- **Missions (≈40–60%)**
 - Direct funding of HII-verified missions, NGO support and Peace Hubs.
- **Operations & Risk (≈20–35%)**
 - Core team, tech, compliance, audits, NGO ops, key partners.
- **Reinvestment into Treasury (≈15–30%)**
 - Compounds the treasury base and increases future mission capacity.

5. Buyback & Burn and other token mechanisms

- When conditions allow (sufficient coverage, healthy liquidity, and a positive treasury trajectory), a small share of the surplus may be allocated to **\$PEACE buyback and burn** programs or other deflationary levers, as defined in Section 7.2.2 and the parameter registry.
\$PEACE BUSINESS PLAN- Draft 1
- These are always subordinate to mission funding, risk management and treasury health.

The result is a **disciplined capital waterfall**:

Treasury protection and mission continuity come first; deflationary or speculative features are strictly secondary.

6.5. Illustrative Financial Scenarios (Conceptual)

These scenarios are **not forecasts**, but tools to help board members and investors understand how the model behaves at different scales.

Peace Soldiers – Board _ Invest...

6.5.1. Conservative Scenario

- **Treasury base:** ~10–15M USD
- **Net APY target:** ~6–7%
- **Annual income (yield + modest ecosystem revenues):** ~\$0.6–1.0M
Peace Soldiers – Board _ Invest...

Illustrative allocation of annual income:

- **~40–50% missions** – 5–8 missions/year at \$50–100k each.
- **~30–35% operations** – lean team, minimal but solid legal/compliance posture.
- **~15–30% reinvestment into treasury.**
Peace Soldiers – Board _ Invest...

Goal:

Prove the end-to-end viability of the system: technical rails, legal structure, NGO flows, governance and HII, with strong capital preservation.

6.5.2. Base Scenario

- **Treasury base:** ~30–40M USD
- **Net APY target:** ~9–10%
- **Annual income:** ~\$3–4M
Peace Soldiers – Board _ Invest...

Illustrative allocation:

- **~50–60% missions** – 15–20 missions/year at \$150–300k each, across several regions.
- **~20–25% operations & risk** – NGO operations, audits, security and compliance scaled up.
- **~15–25% reinvestment into treasury.**
Peace Soldiers – Board _ Invest...

Goal:

- Sustain a meaningful, recurring mission pipeline.
- Establish Peace Soldiers as a **reference protocol** for peace / impact funding in Web3.
Peace Soldiers – Board _ Invest...

6.5.3. Upside Scenario

- **Treasury base:** ~50–100M USD (after strong IDO, partnerships, organic growth).
- **Effective ROI target:** up to ~15% under favorable conditions (e.g., RWA performance, Peace Store upside, launch-related inflows).

Capabilities in this state:

- Support **20+ missions/year** with higher average budgets and deeper field presence.
- Maintain robust reinvestment rates to grow the treasury further.
- Allocate a structured portion to innovation (advanced HII analytics, regional Peace Hubs, cross-chain extensions), without endangering core mission capacity.

Across all scenarios, **the design logic is identical:**

Capital → Treasury → Yield & Revenues → Missions → HII & stories → Stronger brand and demand → More capital → Stronger treasury → More missions.

Only **scale and speed** change; the economic DNA remains constant.

6.6. Alignment & Value Accrual

The business model is engineered so that **better missions and stronger governance improve outcomes for all participants**:

Peace Soldiers – Board _ Invest...

- **For beneficiaries and NGOs:**
 - More high-quality missions → stronger HII track record → better access to funding and reputational capital.
- **For users and community:**
 - Each contribution, verification or governance action feeds into Peace Passports and HII, unlocking roles, access and influence—not just one-off rewards.
Peace Soldiers – Board _ Invest...
- **For token and NFT holders:**
 - A healthier, well-governed treasury, increasing real-world legitimacy and expanding mission pipeline should drive **organic demand** for \$PEACE (utility, access, governance) rather than purely speculative cycles.
- **For investors and strategic partners:**

Exposure is tied to a transparent, scenario-tested treasury with explicit risk limits and clear reporting (Sections 7, 11 and 12), not to opaque grant-making.

Over time, as the **treasury, identity graph and HII database** grow, Peace Soldiers becomes harder to copy and easier to trust. The business model aligns **finance, impact and governance** in a form that is:

- Familiar to institutional capital (endowment-style, scenario-driven).
- Attractive to Web3 communities (transparent, programmable, DAO-governed).
- Usable for NGOs and ordinary users (Web2.5 UX, story-driven, mobile-first).

6.7. Similar ReFi Projects to Peace Soldiers

Peace Soldiers is a pioneering ReFi (Regenerative Finance) protocol that bridges Web3 capital with verifiable peace and development missions through an endowment-style treasury, impact measurement (HII), DAO governance, and community tools like NFTs and a Peace Store. While pure "peace-focused" Web3 projects are emerging, they remain niche (often tied to humanitarian aid). In contrast, the broader ReFi space in 2025 emphasizes social impact, transparent funding, and community-driven treasuries for regenerative outcomes, such as financial inclusion, local empowerment, and conflict aid. Below, we

highlight 8 similar projects, selected for their alignment in treasury models, impact tracking, and social/regenerative focus. These draw from environmental restoration to humanitarian efforts, with many using blockchain for endowment-like sustainability.

Project	Description & Key Features	Similarities to Peace Soldiers	Token/Governance	Impact Measurement	Status/Notes (2025)
KlimaDAO	Community-driven protocol tokenizing carbon credits into a decentralized treasury for climate action; funds reforestation and emission offsets via DAO-voted grants. Features modular AMM for liquidity and retirement certificates.	Endowment-style treasury (carbon-backed, yield funds missions); DAO governance with community voting; transparent funding for long-term regenerative projects (e.g., developer support).	\$KLIMA (governance, staking for yields); DAO voting.	On-chain carbon retirement tracking; verifiable offsets and market demand metrics.	Active; KlimaDAO 2.0 launched Q1 2025, treasury >\$50M.
Celo	Mobile-first blockchain for financial inclusion in underserved regions; funds ReFi/social projects (e.g., micro-UBI, clean energy) via grants and stablecoins collateralized by community treasury. Integrates with Ethereum L2 for scalability.	Treasury collateralizes stable assets for mission funding; hybrid governance (staking/elections); focuses on development in fragile areas like conflict zones.	\$CELO (staking, Validator elections + grants program).	On-chain adoption metrics (e.g., wallet users, aid distributions); partnerships track inclusion outcomes.	Mature; Celo Foundation grants >\$100M allocated to social ReFi in 2025.
Regen Network	Blockchain for ecological credits; rewards land stewards (farmers/communities) with tokens for sustainable practices like biodiversity protection. Enables trading of verified environmental data.	Community funding for local missions (e.g., reforestation as "development"); treasury-like reserves from credit sales; empowers marginalized groups economically.	\$REGEN (rewards, trading); DAO for project verification.	Scientific verification of ecological outcomes (e.g., soil health metrics); tokenized proofs of impact.	Growing; Expanded to social equity pilots in Africa/MENA in 2025.
Giveth	Decentralized donation platform for social impact projects; streams real-time funding to verified causes via Superfluid, with DAO oversight for grant allocation.	Transparent, continuous funding (like yield-based missions); identity/reputation systems; community governance for	\$GIVETH (rewards for donors); DAO proposals via Snapshot.	Project dashboards with on-chain donation flows and outcome reports; community-voted impact audits.	Established; Integrated with 50+ social DAOs by mid-2025.

			impact-aligned treasuries.			
Fundi Protocol	Decentralized infrastructure for funding public goods and social/climate missions; uses crypto for transparent grants to NGOs/communities, with yield from DeFi reinvested.	ReFi treasury for humanity-focused missions; DAO for proposal vetting; emphasizes social impact over speculation.	\$FUNDI (utility for grants); DAO governance.	KPI-based grant reporting; on-chain traceability of fund usage.	Early-stage; Raised seed in Q2 2025 for social impact pilots.	
AidChain	AI-blockchain system for transparent refugee aid in conflict zones; tracks distributions to prevent corruption, with smart contracts for automated releases.	Mission-focused funding in fragile areas (similar to peacebuilding); endowment-like pooling for sustained aid; Web3 for verifiable humanitarian impact.	No native token (uses ETH/Stellar); Smart contract governance.	Real-time traceability of aid flows; AI-audited outcomes (e.g., recipient verification).	Ideation winner (AI4P Challenge, 2025); Piloting in Ukraine/Jordan.	
WFP Building Blocks	UN World Food Programme's blockchain platform for cash transfers and supply chain tracking in refugee camps/conflict areas (e.g., Jordan, Ukraine); enables donor tracing of funds to meals/services.	Transparent treasury for humanitarian missions; yield-like efficiency savings reinvested; focuses on conflict resolution via food security.	No token (uses Stellar/ETH); Centralized with Web3 transparency.	On-chain ledgers for \$325M+ in aid; metrics like cost savings (\$67M in 2024-25) and beneficiary reach.	Scaled; Delivered to 1M+ refugees by 2025.	
ReFi The Hague	Community program matching local co-funding for regenerative/social projects; uses Ethereum tools (Karma GAP, Snapshot) for governance and impact tracking, with <25% overhead.	Local "Peace Hub"-like model for missions; hybrid DAO for funding decisions; treasury from matched grants for sustained community impact.	No native token; Uses ETH/Snapshot voting.	On-chain impact dashboards; community-voted KPIs for project success.	Active in Europe; Replicable framework adopted by 10+ cities in 2025.	

Key Trends in Similar Projects (2025)

- **Treasury & Sustainability:** Like Peace Soldiers' \$30-40M endowment (yield-funded missions), projects like KlimaDAO and Celo utilize backed treasuries to preserve principal while funding operations via yields/revenues, thereby avoiding donation fatigue.

- Impact Verification: HII-like metrics are common (e.g., Regen Network's scientific audits, Giveth's dashboards), ensuring "peace per dollar" through on-chain proofs.
- Governance: Hybrid DAOs (identity-bound in Peace Soldiers) appear in Giveth/Fundi, preventing whale capture while enabling community input.
- Social/Peace Focus: While environmental ReFi dominates (e.g., Toucan/Moss.Earth for Amazon ties to indigenous peace), humanitarian Web3 (AidChain, WFP) directly overlaps with conflict aid. Pure peace Web3 is nascent but growing via challenges like AI4P.
- Challenges & Opportunities: Scalability in low-connectivity zones (e.g., Celo's mobile focus) mirrors Peace Soldiers' Telegram MiniApp. 2025 sees increased RWA integration (up to 30% in treasuries) for impact-aligned yields.

These projects position ReFi as a "PeaceFi" precursor, turning Web3 into a bridge for social good.

7. Token, Treasury & Financial Model

This section explains how the \$PEACE token, the DAO treasury and the financial model work together to power the Economy of Peace:

- How \$PEACE is issued, allocated and made scarce,
- How the treasury is structured and how yield is generated,
- How missions are funded and what scenarios the board should expect.

It is a summary lens on the deeper Tokenomics & TGE Master Report, DAO Master Report, and Investor & Launch Package.

7.1. Design Objectives & Principles

The token and treasury are engineered around three core objectives:

1. Mission-linked value, not pure speculation

- Token supply, burns and buybacks are tied to:
 - real economic activity in the Peace Store,
 - treasury health and yield,
 - and HII-verified impact and contributions.
- There are no unsustainably high APR promises; demand is meant to come from:
 - real usage,
 - real governance,
 - and verifiable impact.

2. Treasury as an “endowment for peace”

- The principal is treated as inter-generational capital:
 - missions are funded primarily from *yield and ecosystem revenues*,
 - base capital is preserved and, ideally, grows moderately over time.
- This makes Peace Soldiers behave more like a university endowment than a short-term donation campaign.

3. Auditability, guardrails & DAO legitimacy

- Every privileged action (emissions, buybacks, grants, large rebalancings) is:
 - governed by clear, parameterized policies,
 - subject to identity-bounded governance and timelocks,
 - and emits machine-readable on-chain receipts.
- Token and treasury controls are designed to withstand:
 - investor due diligence,
 - internal/external audits,

- and, over time, regulatory scrutiny.

These principles are the backbone of the Peace Wealth Cycle:

Capital → treasury → yield & revenues → missions → HII-verified impact → stronger brand & demand → more capital → stronger treasury → more missions.

7.1.2. Security & Treasury Council Mandates, Elections & Recall

The Security & Treasury Council is introduced as a pragmatic early-phase safety layer, not as a permanent unelected committee. In Phase 0–1, council members are appointed by the founding entities (NGO, Foundation and core team) based on experience, reputation and operational capacity. Their role is to safely execute policy decisions that have already passed through the DAO, not to define policy unilaterally.

From Phase 1 onwards, each council member serves a fixed on-chain mandate (e.g., 12–18 months, with the precise duration defined in the DAO Parameter Registry). At the end of each mandate, a renewed mandate must be explicitly granted by the DAO via a governance proposal, or the seat is opened for a new candidate. The DAO also retains the right to recall one or more council members at any time via a C3-class proposal, subject to predefined quorum and majority thresholds.

To avoid entrenched power, term limits apply: no individual may serve more than a capped number of consecutive mandates (for example, two consecutive terms, with a cooling-off period in between). This rotation policy, together with identity-bounded voting and transparent address registries, ensures that the Security & Treasury Council remains an accountable, revocable execution layer rather than a de facto multisig oligarchy.

7.2. \$PEACE Token – Role, Supply & Scarcity

7.2.1. Purpose & Functional Rights

\$PEACE is the coordination asset of the Peace Soldiers ecosystem.

Utility & access

- Medium of exchange and discount token in the Peace Store and integrated services.
- Feature unlocks in the MiniApp and dApp suite:
 - advanced mission views,
 - priority access to specific campaigns,

- premium tools for NGOs and power users (as permitted by law).

Incentives

- Rewards for:
 - HII-verified missions,
 - treasury-aligned contributions (e.g., governance, liquidity, verifications),
 - ecosystem contributions (development, content, integrations).
- Long-term alignment of team, advisors and partners via vested allocations, not short-term bonuses.

Governance

- \$PEACE is used in identity-capped voting for PS-DAO:
 - parameters, treasury ranges and program budgets,
 - upgrades to the HII framework,
 - Peace Store and partner policies.
- Governance weight is combined with Peace Passport identity and reputation, so power cannot be bought solely with token balance.

Important: \$PEACE does not represent an equity claim, debt claim, or direct entitlement to profits, dividends or ownership in the legal entities. Its role is strictly utility, access and governance, within the applicable legal frameworks.

7.2.2. Supply, Emissions & Deflation Levers

Fixed max supply

- 10 billion (10,000,000,000) \$PEACE total.
- All tokens are minted at genesis; no further minting beyond the agreed supply.

Emission schedule (4-year decay)

A limited emission budget is reserved for ecosystem growth programs, distributed according to an exponentially decaying schedule:

- Year 1: 600M (6% of total supply)
- Year 2: 450M (4.5%)
- Year 3: 300M (3%)
- Year 4: 150M (1.5%)

Total emissions over the first 4 years: 1.5B \$PEACE (15% of supply).

After Year 4, baseline emissions drop to near zero, with only small, governance-controlled top-ups if needed.

Deflation & scarcity mechanics

To offset emissions and tie scarcity to real activity:

- Peace Store fee burn
 - A small fee (e.g., 1% on net marketplace fees) can be used to buy and burn \$PEACE, subject to DAO policies.
- Reward claim burn
 - When users claim certain \$PEACE rewards (e.g., from missions, quests), a 0.75% burn on the claim amount is applied at contract level.
 - This links scarcity to concrete contributions and discourages low-effort farming.
- NFT / Passport upgrade burns
 - Leveling up selected NFTs or Peace Passport tiers can require burning small amounts of \$PEACE, turning identity progression into a long-term demand source.
- Surplus yield buyback-and-burn
 - When treasury performance exceeds policy thresholds, a surplus share of yield or Store income can be routed to buybacks and burns, under strict governance and only after:
 - mission budget requirements are met,
 - operations and risk buffers are funded,
 - minimum reinvestment floors are reached.

Under realistic activity and adoption:

- Gross inflation is *capped* at 15% over the first four years.
- After Year 3, as burn sources accumulate, the token is structurally biased toward low-inflation or mildly deflationary dynamics, assuming normal usage and prudent governance.

This makes \$PEACE predictable and discipline-friendly compared to open-ended inflation models.

7.3. Distribution, Vesting & Liquidity

7.3.1. Allocation & Rationale

Allocation is deliberately community-major and treasury-strong.

Bucket	% Supply	Primary Rationale
Community & Ecosystem	45%	Airdrops, missions, HII programs, staking, growth
Treasury (Strategic)	25%	Runway, mission co-funding, buybacks under guardrails
Team	15%	Long-term alignment, 12m cliff, 24–36m vesting
Partners / Investors	10%	Milestone-gated tranches, outcome-linked
Liquidity	5%	DEX LPs with ≥ 12 -month locks

\$PEACE – Token Allocation

Key positioning points

- 45% Community & Ecosystem
 - Ensures broad, long-term community participation in governance, missions and growth programs.
- 25% Treasury (Strategic)
 - Anchors an on-chain mission endowment and provides dry powder for:
 - co-funding high-HII missions,
 - supporting liquidity during stress,
 - strategic buybacks when safe.
- 15% Team
 - Enough to be strongly aligned, but not enough to dominate governance, especially with Passport caps.
- 10% Partners / Investors

- Sized for strategic capital (Web3 funds, impact funds, angels, NGOs) with long-term horizons.
- 5% Liquidity
 - Dedicated to seeding LPs; combined with treasury tools and market makers, this supports healthy price discovery without excess dilution.

This distribution is consistent with 2024–2025 best practices for serious protocols: community-major, treasury-strong, and guarded against single-stakeholder dominance.

7.3.2. Vesting & Unlock Safety

To avoid “launch → dump → collapse” dynamics:

Team

- 12-month cliff, followed by 24–36 months linear vesting.
- No TGE issuance for the team.
- No accelerated vesting without a constitutional-level DAO decision.

Partners & early investors

- Milestone-gated tranches tied to clear deliverables:
 - integrations,
 - co-funded missions,
 - infrastructure or ecosystem commitments.
- Clawback mechanisms for non-delivery wherever legally enforceable.

Community programs

- Emissions are claim-gated:
 - rewards are “earned” over time,
 - but are only minted and transferable when claimed.
- At claim-time, 0.75% of the claimed amount is burned, tying scarcity to real participation.

Liquidity

- LP tokens for core pools are locked for at least 12 months in program-controlled custody.
- For any early unlocks or changes:
 - high-threshold governance (e.g., supermajority, multi-council approvals) is required,
 - With on-chain receipts and timelocks.

Unlock risk monitoring

The DAO and board track:

- Top-10 holder share,
- Gini coefficient and concentration metrics,
- DEX/CEX liquidity depth bands,
- Coverage months and buffer ratios.

If risk indicators breach policy thresholds, automatic or governance-triggered throttles can:

- slow emissions,
- increase reinvestment,
- limit treasury-driven buybacks,
- Or adjust liquidity provisioning.

This makes unlock behavior predictable, observable, and correctable.

7.3.2. X+1 Timelocks, Execution SLOs & Permissionless Execution

Timelocks are introduced to create a safety buffer between a passed vote and on-chain execution—not to become an operational bottleneck. Peace Soldiers therefore couples timelocks with clear execution service-level objectives (SLOs) and, where technically feasible, permissionless execution.

For C1-class proposals (security-critical or emergency actions), the DAO targets execution within X hours after timelock expiry. For C2- and C3-class proposals (standard policy and parameter changes), the target is Y and Z hours respectively. These SLOs are codified in the DAO's operational playbooks and reflected in council and subDAO responsibilities.

Wherever technically feasible, queued proposals become “permissionless to execute” after the timelock expires: any address may trigger the execute function, while the Security & Treasury Council retains only the right to cancel or veto during the timelock window according to pre-defined rules. This pattern ensures that timelocks remain a safety mechanism and do not create a single point of operational failure.

7.4. Treasury Architecture & Yield Model

The DAO treasury is the economic engine of Peace Soldiers.

It is structured to:

- Generate conservative, diversified yield,
- Support PoP (proof-of-peace) missions from recurring income,
- And maintain a robust financial buffer in volatile markets.

7.4.1. Size & Composition

Design-wise, we model three bands:

- Conservative band: ~10–15M USD
- Base band: ~30–40M USD
- Upside band: ~50–100M USD

At full strategic allocation (e.g., 25% of 10B \$PEACE at a launch price around \$0.02), the notional maximum treasury could be ~50M USD.

However, our core planning and risk models use the more conservative 30–40M USD base band as the reference case.

Illustrative base-case portfolio

As defined in the Tokenomics & TGE Master Report:

Instrument	Portfolio Share	Est. APY	Purpose
Stablecoin yield pools (USDC etc.)	40%	~8%	Low-risk baseline income
\$PEACE/SOL LP positions	40%	~12%	Market depth + DEX fee revenues
DeFi staking (SOL, mSOL, etc.)	15%	~10%	Diversified yield & potential upside
Operational reserve (cash/buffer)	5%	—	Liquidity & contingency

Weighted blended target: $\approx 9\text{--}10\%$ net APY *before* insurance, fees and conservative haircuts.

All figures are illustrative, not guarantees, and subject to formal risk limits and DAO-approved ranges.

7.4.2. Funding Logic & Compounding

On a yearly cycle, cash flows are handled in four steps:

1. Yield realization
 - Rewards, interest and fees from treasury strategies are realized into stable assets or other base units.
2. Budgeting for missions & operations
 - The DAO, guided by councils and KPIs, sets:
 - mission budget envelopes,
 - operations & risk budgets,
 - minimum reinvestment floors.
3. Reinvestment and buffer management
 - Any yield beyond mission + operations + safety buffers is reinvested into the treasury portfolio, compounding over time.
4. Surplus-only buybacks
 - A governed share of true surplus (defined as yield above compounding, mission and risk needs) can be used to:
 - buy back \$PEACE on the open market,
 - and either burn it or re-treasury it, depending on policy.

Example – base-case year (illustrative)

Assume:

- Treasury = 35M USD,
- Net APY $\approx$ 9.5%,
- Annual gross income $\approx$ 3.3M USD.

A policy might target:

- $\sim$ 55% ($\approx$ 1.8M) to missions,
- $\sim$ 22% ($\approx$ 0.7M) to operations & risk,
- $\sim$ 23% ($\approx$ 0.8M) reinvested into the treasury,

With buybacks only from additional upside (e.g., Peace Store over-performance or favorable RWA returns).

This keeps Peace Soldiers mission-heavy, operations-lean, and treasury-protective.

7.5. Impact-Hedged Diversification & RWA (Phase 2–3)

Over time, the treasury can add an “impact-hedged” layer by allocating a portion of capital to regulated, impact-linked real-world assets (RWAs).

Conceptual direction (subject to legal & risk review)

- Gradual move toward up to ~30% of the treasury in impact-linked instruments in Phase 2–3, such as:
 - microfinance or SME loans in peace regions,
 - social or development impact bonds,
 - Sustainable infrastructure in fragile contexts (e.g. water, energy, schools) via compliant tokenization platforms.

Peace Bonds (concept)

- NFT- or token-wrapped positions where:
 - Principal sits in diversified yield/RWA strategies,
 - High-HII missions and/or regions can unlock bonus yield from aligned ESG / impact partners.

Benefits:

- Diversifies away from pure crypto volatility.
- Attracts impact funds and ESG allocators who require RWA exposure.
- Enhances effective returns in upside scenarios (toward ~12–15% blended), while keeping principal preservation and mission priority at the core.

All RWA activity is subject to:

- stringent jurisdictional and regulatory reviews,
- clear counterparty risk assessments,
- hard allocation caps and concentration limits defined by the DAO.

7.6. Contribution-Compounded Incentives

To avoid “APR farming” or pure plutocracy, incentives are designed so that upside tracks contribution and impact, not just wallet size.

Dynamic emissions linked to treasury health

- Emission contracts can throttle or pause certain reward programs if:
 - treasury net APY falls below policy thresholds,
 - or coverage-month and buffer metrics drop under safe floors.
- This aligns long-term holders with prudent, conservative treasury management.

Wealth Redistribution Pool

- A fixed share of ecosystem inflows (e.g., ~20% of net Peace Store revenues and selected partner fees) feeds a dedicated Wealth Redistribution Pool.
- This pool distributes additional \$PEACE to:
 - high-HII Passport holders,
 - verified mission contributors and local actors,
 - Long-term aligned stakers who lock tokens and participate in governance.

Identity-bounded rewards

- Passport identity is used to:
 - cap rewards per person,
 - discourage Sybil/farming behavior,
 - weight rewards by quality of contribution (HII, verifications, governance participation) rather than sheer capital.

Over time, this creates a contribution-compounded token distribution:

- those who create and verify impact are the ones who gain more voice and upside in the system.

7.7. Mission Funding & Use of Proceeds

Mission funding is the primary purpose of the treasury.

Funding sources

- Treasury yield (primary, in stable assets or base tokens).
- Peace Store margins & protocol fees.
- Donations & co-funding from NGOs, foundations, DAOs and impact partners.

The principal is not used for routine mission spending in base and upside conditions; it may only be tapped under extraordinary, governance-approved circumstances (e.g., a humanitarian emergency or existential protocol risk).

Illustrative base capacity

In the base scenario ($\approx 30\text{--}40\text{M}$ treasury, $\approx 9\text{--}10\%$ net APY):

- annual yield of $\approx 3\text{--}4\text{M}$ USD can support:
 - 15–20 missions per year,
 - at an average scale of \$150–300k per mission,
 - while still funding operations and reinvesting a significant share.

Use of proceeds (high level)

- Missions: grants, local staffing, equipment, logistics, training, monitoring & evaluation.
- Operations & risk: product development, infrastructure, legal/compliance, audits, Peace Hubs.
- Reinvestment: strengthening the treasury to maintain or grow mission capacity.

The DAO explicitly tracks:

- mission spend,
- operations spend,
- reinvestment,
- and any exceptional draws on principal,

With dashboards that both the board and the community can audit.

7.8. Scenario Ladder & “Peace Wealth Cycle”

To understand resilience, we model three main bands for the Peace Wealth Cycle.

All numbers are illustrative, not forecasts.

Conservative scenario

- Treasury: ~10–15M USD
- Net APY: ~6–7% (mostly stables + high-grade yield)
- Missions: 5–8 per year
- Focus: pilots, proof of concept, data collection, minimal burn.

Base scenario

- Treasury: ~30–40M USD
- Net APY: ~9–10% (blended crypto + limited RWA)
- Missions: ~15–20 per year
- Focus: robust DAO, maturing Peace Store, multiple regions, HII dataset expansion.

Upside scenario

- Treasury: ~50–100M USD
- Effective APY: up to ~12–15% in favorable conditions (successful RWA, Store, partnerships, IDO/NFT upside)
- Missions: 20+ per year, with increasing HII per dollar spent
- Focus: global Peace Hubs, advanced analytics, cross-chain expansion.

In each band, the Peace Wealth Cycle is the same:

1. Capital aggregates into a transparent, diversified treasury.
2. Yield + revenues fund HII-verified missions and core operations.
3. Missions generate measurable impact and stories, strengthening trust and brand.
4. Trust attracts more capital, users, NGOs and partners.
5. The treasury and ecosystem scale, enabling more and better missions.

The difference between scenarios lies in their scale and speed, not in their underlying logic.

7.9. Governance, Risk & Reporting (Summary)

Finally, token and treasury controls are tightly integrated with governance and risk management.

Governance & control

- Identity-bounded voting (e.g., per-identity caps) and a delegate registry reduce capture risk.
- Critical actions (e.g., large buybacks, RWA allocations, parameter changes) require:
 - multi-council approvals,
 - on-chain timelocks,
 - And clear quorum and threshold rules.

Risk & coverage metrics

- The DAO and board monitor:
 - coverage months (runway),
 - liquidity depth,
 - counterparty risk for RWA and DeFi positions,
 - diversification and concentration limits,
 - emission and unlock profiles.

These feed governance triggers, such as:

- tightening or loosening mission budgets,
- adjusting RWA caps,
- throttling emissions,
- or temporarily pausing certain programs.

Audits & transparency

- External smart-contract audits and treasury security reviews are standard before major launches.
- Internal quarterly financial reports and impact reports summarize:
 - Treasury composition and yields,
 - mission budgets and HII outcomes,
 - \$PEACE emission, burn, and buyback activity.

For the board and investors, the message is straightforward:

Peace Soldiers is not only a mission-driven NGO protocol;

It is a disciplined, parameterized, audit-ready financial system designed to fund peace at scale—

With a token and treasury model that are mission-linked, risk-aware, and built for the long run.

8. Go-To-Market & NGO Strategy

The go-to-market (GTM) strategy is designed to spin up both sides of the Peace Soldiers ecosystem at once:

- onboarding users into the PS MiniApp and Peace Passport identity layer, and
- onboarding NGOs and missions into the HII-based funding pipeline.

The goal is not just growth in user numbers or token holders; it is to feed the Peace Wealth Cycle:

User engagement → missions executed → HII-verified impact → stronger brand & token demand → treasury growth → reinvested yield → more and better missions.

GTM therefore focuses on:

1. A Web2.5 funnel that brings users from awareness to committed participation.
2. A Year 1 “lighthouse” NGO strategy that prioritizes depth over breadth.
3. A narrative engine (Peace Ambassadors + content) that makes peace missions mainstream and investable.
4. A partnership and KPI framework that keeps growth disciplined and measurable.

8.1. User Acquisition (Web2.5 Funnel)

8.1.1. Funnel logic

The GTM model follows a classic, measurable 4-step Web2.5 funnel:

Awareness → Engagement → Conversion → Retention

- Awareness – people hear about Peace Soldiers and the idea of a “Peace Economy”.
- Engagement – they open the MiniApp, explore missions, and absorb the narrative.
- Conversion – they take a concrete action (claim a Passport, support a mission, buy in the Peace Store).
- Retention – they come back regularly, track missions, and join governance or referrals.

Each stage is instrumented with analytics so we can see where users drop off and adjust messaging or UX accordingly.

8.1.2. Awareness

At the top of the funnel, Peace Soldiers uses a mix of digital, community and earned media:

- Telegram Ads & channel collaborations
 - Native to where the MiniApp lives.
 - Focus: short, emotional narratives (“Help fund a school in X”, “Support families after Y”) with frictionless entry.
- Short-form content (TikTok, Instagram Reels, YouTube Shorts)
 - Visual “before/after” mission stories, HII explained in 30 seconds, behind-the-scenes of NGOs and Peace Hubs.

- Content marketing & newsletters
 - Articles and explainers on “PeaceFi”, endowment-style funding for peace, and case studies.
 - Distributed via Medium, Substack, LinkedIn and relevant Web3 / NGO publications.
- Ecosystem partners & events
 - Co-marketing with Solana ecosystem projects, launchpads, ReFi DAOs and NGO alliances.
 - Panels at Web3 conferences, impact/ESG events and peace/NGO forums.

Awareness campaigns are primarily evaluated based on cost per engaged MiniApp visit and downstream funnel behavior, rather than vanity metrics.

8.1.3. Engagement

Once users land in the MiniApp or on the site, the focus shifts to education and emotional connection:

- Onboarding flow
 - “What is Peace Soldiers?” explained in 3–4 simple screens.
 - Visual overview of the Peace Wealth Cycle and HII.
- Mission-centric exploration
 - Users browse missions by theme (water, education, youth, women, reconciliation) and region.
 - Each mission card shows: NGO partner, budget, HII plan, progress bar, and testimonials where available.
- Peace Academy micro-content
 - Bite-sized explanations of treasury, HII, Passports and governance.
 - Designed to convert curiosity into confidence: “I understand enough to participate.”

Key metric: % of visitors who reach mission or Passport pages and spend meaningful time (scroll depth, video completion, micro-quizzes).

8.1.4. Conversion

Conversion is defined as “first meaningful action”:

- claiming a Peace Passport,

- supporting a mission (any amount),
- buying from the Peace Store,
- or signing up as an NGO, partner or verifier.

Tactics:

- Simple, low-friction actions
 - “Support your first mission with \$5–\$20” using crypto or fiat on-ramp (where compliant).
 - “Claim your Peace Passport in 30 seconds” with Telegram login or email.
- Starter quests
 - Basic mission-related tasks that reward users with small Passport upgrades and optional \$PEACE rewards.
 - Examples: reading a mission brief, sharing a mission, answering 3 questions about HII.
- Social proof
 - Real-time counters (“X Peace Passports issued”, “Y missions funded”, “Z people reached”).
 - Highlighted NGOs and Peace Hubs show that the system is real and not theoretical.

Conversion metrics: Passport conversion rate, mission support rate, and Peace Store first-purchase rate.

8.1.5. Retention

Retention means users:

- return monthly or weekly,
- follow mission updates,
- and gradually step into deeper roles (governance, referrals, volunteering, content creation).

Mechanisms:

- Mission update feeds & notifications
 - Short updates when milestones are hit, media is added, or HII scores are published.
 - Users can “follow” specific missions, NGOs or regions.

- Peace Quests & seasonal campaigns
 - Time-bound campaigns (e.g., “Peace Month in MENA”, “Youth Education Quarter”) with:
 - cumulative mission support goals,
 - storytelling arcs,
 - achievement badges and modest \$PEACE rewards.
- Governance & community participation
 - Simple, mobile-friendly governance flows for key decisions:
 - which missions move to full funding,
 - treasury parameter ranges,
 - partner onboarding in Peace Hubs.
 - Regular “governance retrospectives” summarizing what the community decided and why.

Retention KPIs: monthly active users (MAU), repeat mission contributions, quest participation, DAO participation rate.

8.1.6. Cohort-specific tactics

Instead of a “one-size-fits-all” GTM, messaging and channels are tailored to four key cohorts (see Section 5):

- Everyday Web2 users / donors
 - Telegram, Instagram, TikTok, YouTube.
 - Simple narratives (“fund a well”, “support a school”), low-ticket entries, fiat options.
 - Emphasis on stories and human impact, not tokens or yields.
- Crypto-native users / ReFi communities
 - Twitter/X, Discord, Web3 podcasts, DeFi dashboards, launchpads.
 - Emphasis on treasury design, TGE mechanics, governance, HII data and PeaceFi positioning.

- Offers: early governance roles, NFT and launch participation, integrations with existing DAOs.
- NGOs & peace practitioners
 - Conferences, NGO networks, mailing lists, peer referrals.
 - Emphasis on stable funding, reporting simplification via HII, and shared infrastructure.
 - Offers: lighthouse mission co-funding, technical support, access to a global Peace Economy.
- High-donor cohorts (philanthropists, family offices, funds)
 - Direct outreach, curated salons, small-group briefings.
 - Emphasis on the endowment model, RWA/“Peace Bond” concepts, and governance oversight.
 - Privacy, compliance and legal clarity are key.

Internally, each cohort has its own target metrics and budget, so GTM can be optimized per segment rather than averaged.

8.2. Year 1 “Lighthouse” NGO Strategy

The NGO strategy in Year 1 is intentionally narrow and deep, not wide and shallow. The goal is to:

- prove that the rails work (mission engine + HII + governance),
- build trust with real NGOs and communities,
- and generate a handful of hero missions with rich data and storytelling.

8.2.1. Regional focus

To manage risk and learn effectively, Peace Soldiers targets 2–3 pilot regions (e.g., MENA, parts of Africa, Eastern Europe – final list to be confirmed with partners and legal advisors).

In each region, the plan is to:

- onboard 2–4 carefully vetted NGOs working on themes such as:
 - water and essential services,
 - education and youth,
 - women and children in conflict-adjacent areas,
 - Conflict prevention, mediation and reconciliation.
- execute 1–2 flagship “hero missions” per NGO, with:
 - clear objectives and theory of change,
 - structured budgets and timelines,
 - HII-compatible KPIs.

This yields approximately 6–12 highly documented missions in Year 1 that serve as:

- proof of technical and operational viability,
- case studies for investors, donors and partners,
- templates for future missions and NGO onboarding.

8.2.2. NGO selection & due diligence

NGOs are selected through a multi-step process:

1. Sourcing & referrals
 - From Peace Soldiers’ legacy network, reputable NGO clusters, and trusted ecosystem partners.
2. Baseline vetting
 - Legal status, governance structure, financial controls.
 - Historical track record and references from existing donors or partners.
3. Mission fit
 - Alignment with Peace Soldiers’ peace-focused themes.
 - Feasibility and scalability of proposed missions.
 - Ability and willingness to integrate HII-style data collection.

4. Pilot agreement

- Clear expectations on:
 - reporting formats and timelines,
 - HII inputs and verification processes,
 - communication and media collaboration.

Where feasible, NGOs are offered capacity-building support (data collection tooling, basic digital transformation, impact storytelling) to help them succeed in the Peace Economy.

8.2.3. Integration with HII & governance

Each lighthouse mission is run end-to-end through the mission engine and HII:

- Missions are recorded on-chain with unique IDs, structured KPIs and tranche schedules.
- NGOs submit evidence (documents, media, third-party attestations) through standardized flows.
- HII scores (0–100) are published publicly with dimension breakdowns.
- PS-DAO (and relevant councils) can adjust future funding and mission tiers based on HII performance.

This creates a tight feedback loop:

better missions → better HII scores → more community trust → more capital → more and better missions.

Year 1 governance remains hybrid:

- councils and the founding team handle sensitive calls (compliance, safety, high-risk regions),
- the community is gradually involved in:
 - mission prioritization,
 - regional expansion choices,
 - high-level budget envelopes.

8.2.4. Scaling beyond Year 1

If lighthouse missions perform as expected, Peace Soldiers scales in Phase 3 (see Section 9) to:

- 20–30 active NGO partners across multiple regions,
- a mix of:
 - short, high-intensity missions (emergency response, rapid mediation),
 - longer, systemic missions (education programs, local institution-building).

At that point:

- HII data is rich enough to inform portfolio-level decisions (which types of missions and contexts deliver best “peace per dollar”),
- Peace Hubs become regional nerve centers coordinating multiple NGOs and local actors,
- and larger institutional partners (foundations, multilaterals, impact funds) can plug into a proven, data-driven rail.

8.3. Narrative-Driven Growth & Peace Ambassadors

Peace Soldiers’ GTM is designed to make “peace missions” a mainstream story, not just a niche Web3 experiment.

Narrative is a core growth engine: people join and stay because they see and feel the impact.

8.3.1. Storytelling Syndicate

Beyond performance marketing, the project builds a Storytelling Syndicate of creators, NGOs, journalists and media outlets:

- Long-form podcasts and interviews
 - For crypto and impact audiences, focusing on:
 - the Peace Economy thesis,
 - real stories from the field,
 - lessons from failed and successful missions.
- Impact media & op-eds
 - Articles in NGO, philanthropy and ESG publications about:
 - accountability in peace funding,
 - on-chain endowment models,
 - case studies from lighthouse missions.
- Conference stages & talks
 - At Web3, ReFi, impact, philanthropy and peace forums.

- Positioning Peace Soldiers as a reference model for “Web3 for Peace”.
- Documentary-style shorts
 - Before/after stories of specific missions, told with sensitivity and dignity.
 - Narratives that highlight local agency, not just donors or technology.

Each hero mission is treated as a story arc:

1. Proposal & community discussion,
2. On-chain funding decision,
3. Field execution with mid-mission updates,
4. HII-verified results and beneficiaries’ stories,
5. Reflections and “lessons learned” published as open content.

This creates episodic engagement: users follow missions like they follow series, but with real-world impact.

8.3.2. Peace Ambassadors

Peace Ambassadors extend the story into existing communities:

- Grassroots Ambassadors (“Local Soldiers”)
 - Community leaders, NGO staff, youth workers who:
 - host local events and workshops,
 - explain the Peace Soldiers model in accessible language,
 - help onboard NGOs and participants onto the rails.
- Digital Creators & Micro-influencers
 - YouTubers, podcasters, TikTokers with engaged audiences in target regions or verticals (education, social justice, conflict resolution).
 - They produce content around missions and the Peace Economy narrative in their own styles.

- High-visibility Peace Ambassadors
 - Carefully selected public figures (artists, athletes, thought leaders) with:
 - a credible record of social engagement,
 - and willingness to engage beyond simple endorsements (e.g., visiting missions, joining governance dialogues).

Ambassadors are not paid hype agents; they are participants in the Peace Economy:

- compensated via a mix of:
 - transparent fees (where appropriate),
 - \$PEACE allocations with vesting,
 - and symbolic assets (special NFTs, Passport tiers),
- subject to ambassador guidelines aligned with NGO ethics and brand safety.

8.3.3. Fiat On-Ramps & High-Donor Strategy

For high-donor cohorts and institutions, narrative must be matched with trusted financial rails:

- Compliance-first fiat on-ramps (where legally feasible)
 - Bank transfers, card payments, and potentially donor-advised fund structures.
 - Clear documentation on tax treatment and reporting.
- Peace Bonds & structured products (conceptual)
 - RWA-backed instruments where:
 - principal is held in diversified, regulated vehicles,
 - coupons are linked to mission performance or region-specific HII outcomes.
- Curated briefings & closed-door events
 - In-person or virtual sessions with:
 - the founding team,
 - regional NGO partners,

- external legal and risk advisors.
- Flagship commitments
 - “Founding Peace Patrons” who commit multi-year support (e.g., 3–5 years) in exchange for:
 - governance advisory roles,
 - visibility in mission storytelling,
 - structured reporting and bespoke dashboards.

The objective is to make Peace Soldiers feel like a credible, transparent and emotionally resonant choice for serious capital that cares about peace.

8.4. Partnerships, Phasing & KPIs

To keep GTM execution disciplined, partnerships and growth are structured by tiers, aligned with the phased roadmap and tracked via a focused KPI set.

8.4.1. Partnership tiers

Five main partnership layers guide outreach and resource allocation:

1. Protocol Alliances (Tier 1)
 - Solana ecosystem, RPC providers, launchpads, DEXs, analytics platforms.
 - Goals: technical integrations, liquidity support, security/audit collaboration, co-marketing.
2. NGO Alliances (Tier 2)
 - International NGOs, local peace organizations, humanitarian networks.
 - Goals: mission sourcing, co-funding, field expertise, HII refinement.
3. Corporate CSR & Brand Partners (Tier 3)
 - ESG-aligned companies, consumer brands, and creative agencies.

- Goals: co-branded Peace Store campaigns, employee engagement, recurring funding channels.
4. ReFi / RWA & Impact Finance Partners (Tier 4)
- Tokenized RWA platforms, microfinance vehicles, impact bond issuers, ESG funds.
 - Goals: Peace Bond structures, diversified treasury allocations, co-labeled products.
5. Media, Creators & Community Partners (Tier 5)
- Creators, media outlets, DAOs, community organizations.
 - Goals: mission storytelling, brand awareness, local and thematic communities.

Each partner tier has clear entry criteria, mutual value propositions and expected KPIs, preventing partnership sprawl.

8.4.2. Phasing

Partnerships and GTM activities are sequenced to match the four phases (Section 9):

- Phase 1 – Prove the rails
 - Focus: Tier 1 (protocol) and Tier 2 (initial NGOs).
 - Outcomes: MiniApp live, first treasury in place, 3–5 lighthouse missions defined.
- Phase 2 – Prove the missions
 - Focus: more Tier 2 NGOs in the same regions, initial Tier 5 media/creator partners.
 - Outcomes: 6–12 executed missions, HII v1 validated, first hero stories published.
- Phase 3 – Prove the economy
 - Focus: scale Tier 2 NGOs, activate Tier 3 (brands) and Tier 4 (ReFi/RWA), deepen Tier 5.
 - Outcomes: Peace Store in full operation, multi-region Peace Hubs, early RWA/Peace Bond experiments.
- Phase 4 – Global reference

- Focus: institutional Tier 2/4 partners (larger NGOs, multilaterals, funds) and high-visibility ambassadors.
- Outcomes: Peace Soldiers recognized as a model for Web3-based peace finance, with regional expansion and structural alliances.

This phasing ensures the protocol does not overpromise on GTM before the rails and lighthouse missions are proven.

8.4.3. GTM & NGO KPIs

To stay accountable, the GTM & NGO strategy is tracked against a focused KPI stack (complementing financial metrics in Section 7 and overall KPIs in Section 13):

User & Community

- Peace Passports issued (e.g., ~10k in Year 1; 25k+ in Year 2).
- Active MiniApp users (MAU) and funnel conversion rates (Awareness → Passport → First Mission).
- DAO participation rate (target $\geq 15\%$ of eligible users in Year 1; $\geq 20\%$ in Year 2).

NGO & Missions

- Number of active NGO partners (e.g., 6–12 in Year 1; 20–30 in Year 2/Phase 3).
- Missions funded and completed per year.
- Average HII score and distribution (e.g., % of missions scoring $\geq 75/100$).

Treasury & Store

- Peace Store GMV and net revenues.
- Share of mission funding coming from:
 - treasury yield,
 - Store revenues,
 - direct donations and co-funding.

- Progress toward base-case treasury band (30–40M USD) and diversification targets.

Narrative & Brand

- Media mentions and event appearances in key verticals (Web3, impact, peace/NGO).
- Content performance (views, completion rates, engagement) for mission stories and educational content.
- Share of new users citing “mission/impact” vs “yield/token” as primary reason for joining (survey-based).

Economics & Wealth Cycle

- Contribution of GTM and NGO activities to the Wealth Impact Ratio (WIR) and other impact-per-dollar metrics.
- Stability and resilience of the Peace Wealth Cycle:
 - how quickly capital deployed into missions translates back into demand, trust and treasury growth.

Together, these elements ensure that Go-To-Market is not just about acquisition numbers, but about building a healthy, evidence-backed Economy of Peace—with NGOs, users, donors and investors all moving in the same direction.

9. Roadmap & Milestones

The Peace Soldiers roadmap is structured around a simple question:

What do we need to prove, in which order, to justify scaling this into a global Economy of Peace?

The answer is four phases, each with a clear focus, concrete deliverables, and explicit exit criteria.

We do not move to the next phase just because time has passed; we move when the evidence is strong enough.

High-level:

1. Phase 1 – Prove the Rails (0–6 months)

Can we make the technical, legal and financial rails work end-to-end in a controlled environment?

2. Phase 2 – Prove the Missions (≈6–12 months)

Can real NGOs run real missions through the rails, and can we measure impact with HII?

3. Phase 3 – Prove the Economy (≈12–26 months)

Can we sustain a recurring pipeline of missions, users and revenues powered by a treasury in the base band?

4. Phase 4 – Prove the Model to the World (26+ months)

Can Peace Soldiers become a reference model for “PeaceFi” and peace-focused impact finance globally?

The phases overlap slightly, but each has its own primary objective, key milestones and “evidence gates” that guide capital deployment and risk.

9.1. Phase 1 – Prove the Rails (0–6 months)

Core question:

Can we stand up the foundational stack – MiniApp, identity, core contracts, governance shell and treasury – in a way that is technically sound, legally robust and operationally feasible?

Strategic focus

- Build and test the technical rails: MiniApp, core contracts, treasury scaffolding.
- Establish the legal and governance chassis.
- Secure a minimum viable treasury and runway via early funding and token events.

Key deliverables

1. Core architecture & MiniApp MVP

- PS MiniApp MVP live (closed beta → open public beta) with:
 - basic onboarding (Telegram / email / wallet),

- Peace Passport issuance v1,
 - mission browsing (demo missions) and a simple contribution flow (even if to test/dummy missions at first).
 - Web dashboard (alpha) for internal ops and selected NGOs:
 - mission registry,
 - basic analytics,
 - admin tools.
2. Smart contracts & on-chain primitives
- \$PEACE token contract suite (minting, vesting, emissions, burns) deployed and audited.
 - Peace Passport cNFT contract (non-transferable, upgradable metadata) deployed.
 - Mission registry / funding contracts (v1) deployed for internal and test use.
 - Treasury vault contracts (or integrations) set up with:
 - stablecoin vaults,
 - \$PEACE/SOL LP seeding mechanisms,
 - basic risk parameters.
3. Governance & legal stack
- Legal structure (Foundation + NGO + OpCo) incorporated and operational.
 - Governance v1:
 - founding team roles defined,
 - core councils (Treasury, NGO, Tech/Risk) formed,
 - PS-DAO v1 configured with constitutional documents and high-level parameter registry.
4. Treasury & funding

- Seed / Strategic Round A closed (or well advanced) and/or private \$PEACE allocations secured.
- Initial treasury seeded in the 10–15M USD conservative band (or a realistic lower band with a clear plan).
- Liquidity plan for major DEX(s) finalized; initial LPs seeded with locked LP tokens.

Phase 1 exit criteria (“gates”)

Peace Soldiers only moves into full Phase 2 when:

- Product rails
 - MiniApp MVP is live and stable for a first cohort of users (internal + early community).
 - Core contracts are audited and passing critical security checks.
- Legal & governance
 - Legal entities are live, banking and compliance flows established.
 - Governance v1 is functioning (councils meeting, parameter registry operational, at least a few internal proposals executed).
- Treasury
 - Treasury is capitalized above a defined minimum threshold (e.g., $\geq 8\text{--}10\text{M USD}$) with clear visibility to climb into the conservative band.
 - Initial yield strategies are deployed and producing real (even if small) returns.
- Early user signal
 - First 1,000–3,000 Peace Passports issued (including internal and friends-of-the-project cohorts).
 - First test missions (internal / low-risk pilots) run through the engine, even at small scale.

Once these gates are met, the project is no longer just a whitepaper; it is a functioning protocol with live rails.

9.2. Phase 2 – Prove the Missions (≈6–12 months)

Core question:

Can we run real, NGO-led missions through the system, measure them with HII, and deliver credible stories and data?

Strategic focus

- Onboard a select group of NGOs in 2–3 pilot regions.
- Execute 3–5 lighthouse missions, end-to-end through Peace Soldiers.
- Validate and refine HII v1 in real-world conditions.

Key deliverables

1. NGO network v1

- 2–3 pilot regions selected (e.g., MENA, parts of Africa, Eastern Europe – final list aligned with partners and legal guidance).
- 6–12 NGO partners onboarded (mix of mid-sized and local organizations).
- Standardized NGO onboarding kit: legal & compliance checklist, HII guide, reporting templates, content templates.

2. Lighthouse missions

- At least 3–5 fully funded missions run end-to-end:
 - youth reconciliation programs,
 - water / basic services projects,
 - education and local capacity-building missions.
 - Each with:
 - clear budgets and KPIs,
 - structured milestones and tranche releases,
 - data collection plan for HII.
3. HII v1 in production
- HII architecture and scoring methodology operationalized:
 - standardized dimensions (reach, depth, sustainability, efficiency, governance, verification),
 - scoring workflows with independent verification where feasible.
 - HII dashboards live (internal + public views), showing scores, dimension breakdowns and mission comparisons.
4. Storytelling & reporting
- Full case studies for each lighthouse mission:
 - before/during/after narratives,
 - visuals, interviews, data highlights.
 - Inclusion of these missions in:
 - investor updates,
 - public comms and media,
 - Peace Store campaigns (where applicable).

Phase 2 exit criteria (“gates”)

Peace Soldiers moves into full Phase 3 once:

- Missions
 - At least 3–5 missions completed through the system with HII scores published ($\geq 70/100$ average, with learnings documented for lower scores).
 - Evidence of operational reliability in at least two regions (fund disbursement, local ops, reporting).
- HII
 - HII v1 has been stress-tested: methodology reviewed after real-world application, with improvements integrated.
 - NGO and donor feedback shows that HII is understandable and useful (not just a black-box score).
- Users & community
 - Peace Passports: $\geq 10k$ issued.
 - Active user cohort that:
 - follows missions,
 - opens mission updates,
 - shows repeat support behavior.
- Governance & risk
 - DAO v1 has approved:
 - at least a few mission budgets,
 - an updated risk policy based on early performance,
 - any necessary adjustments to treasury strategies and emission programs.

By the end of Phase 2, Peace Soldiers has proof-of-mission, not just proof-of-tech.

9.3. Phase 3 – Prove the Economy (≈12–26 months)

Core question:

Can the Peace Wealth Cycle sustain a recurring pipeline of missions, users and revenues with a robust treasury in the base band?

Strategic focus

- Scale from pilots to a steady mission pipeline across multiple regions.
- Launch the Peace Store and deepen treasury diversification (including impact-aligned RWAs where appropriate).
- Mature PS-DAO governance so it can assume more real power.

Key deliverables

1. Mission pipeline & Peace Hubs

- 15–20 missions/year funded (base scenario), across multiple themes and geographies.
- 20–30 active NGO partners, with at least some:
 - running multiple missions,
 - co-designing HII refinements.
- Establishment of Peace Hubs in at least 2–3 regions:
 - local coordination structures,
 - shared infrastructure and meeting spaces (digital or physical),
 - regional ambassadors and councils.

2. Peace Store in full operation

- Launch of the Peace Store with:
 - a curated set of physical and digital products,

- co-branded campaigns with NGOs and brands.
 - Clear linking of SKUs to:
 - specific missions,
 - HII outcomes,
 - contributions to the Wealth Redistribution Pool.
 - Monthly or quarterly reporting of:
 - GMV, net revenue, mission funding contributions.
3. Treasury in base band
- Treasury in or approaching the 30–40M USD base band via:
 - follow-on capital events (if needed),
 - organic growth (yield, Store revenues, stable markets).
 - Diversified portfolio as per the Tokenomics report:
 - stables,
 - \$PEACE/SOL LPs,
 - blue-chip staking,
 - initial RWA allocations (up to capped percentages) in collaboration with regulated partners.
4. Governance v2
- Increased share of:
 - mission budgets,
 - treasury ranges,
 - emission adjustments
governed via PS-DAO voting (combined with council approvals where needed).

- Governance UX refined for:
 - mobile devices,
 - non-crypto natives (Web2.5 flows),
 - clear summaries for busy board members and donors.

Phase 3 exit criteria (“gates”)

Peace Soldiers is ready to position itself as a global reference when:

- Economy & scale
 - Treasury is stably within or near the base band (30–40M USD), with $\geq 9\text{--}10\%$ net APY in normal conditions.
 - Missions: $\geq 15\text{--}20$ per year with consistent HII performance (e.g., $\geq 70/100$ median HII, improving over time).
 - Peace Store:
 - meaningful GMV,
 - material contributions to mission funding and the Redistribution Pool.
- Community
 - Peace Passports: $\geq 50\text{k}$ issued across regions.
 - Active monthly users: $\geq 10\text{--}20\text{k}$.
 - Governance participation: $\geq 20\%$ of eligible accounts engaged at least once per quarter.
- Governance & compliance
 - DAO v2 functioning reliably; constitutional changes and parameter updates executed without major incidents.
 - Legal structure and RWA components reviewed and stress-tested by reputable external experts.

- At least one independent external audit (technical and/or financial) completed and published.

At this point, Peace Soldiers is not a pilot; it is an operational PeaceFi economy with real missions, data and momentum.

9.4. Phase 4 – Prove the Model to the World (26+ months)

Core question:

Can Peace Soldiers become a global standard for peace-focused impact finance and reporting, with institutional-grade adoption and recognition?

Strategic focus

- Scale Peace Hubs and NGA alliances globally.
- Deepen integrations with impact funds, multilaterals and RWA infrastructure.
- Position Peace Soldiers as a reference model for regulators, academics and ecosystems.

Key deliverables

1. Global Peace Hubs network

- Peace Hubs in multiple regions (MENA, Africa, Eastern Europe, Latin America, Asia-Pacific, etc.).
- Hubs serve as:
 - local coordination centers,
 - training and capacity-building nodes,
 - real-time feedback loops between missions and governance.

2. Institutional-grade products & partnerships

- Structured Peace Bond products and impact-linked instruments with:
 - regulated RWA partners,
 - ESG and impact funds,

- potentially multilateral entities.
- Integrations with:
 - impact banking / philanthropy platforms,
 - large NGO networks,
 - corporate CSR platforms.
- 3. Advanced HII & data commons
 - HII v2/v3 with:
 - better contextualization by region and mission type,
 - AI-assisted anomaly detection and risk scoring,
 - benchmarks for “peace per dollar” across geographies.
 - Public data commons accessible to:
 - researchers,
 - journalists,
 - think tanks,
 - other protocols.
- 4. Brand & policy recognition
 - Peace Soldiers recognized in:
 - academic papers and policy briefs,
 - industry reports on Web3 x impact,
 - case studies by NGOs and regulators.
 - Participation in global peace, development and digital public infrastructure dialogues.

Phase 4 horizon

Unlike earlier phases, Phase 4 is less about “exiting” and more about continuous evolution:

- expansion to new regions and sectors,
- improving HII and governance,
- collaborating on standards (data, reporting, identity) with the broader ecosystem.

Success is measured not only by treasury size or number of missions, but by whether Peace Soldiers has changed the default way that peace missions are financed and measured.

9.5. Dependencies, Risks & Flexibility

The roadmap is evidence-driven, not calendar-driven. Several factors may accelerate, slow or reshape specific steps:

- Regulatory shifts
 - May affect token event timing, RWA strategies, or permitted user funnels in certain jurisdictions.
 - Mitigation: modular design, regional tailoring, and continuous legal monitoring.
- Market conditions
 - Deep bear markets may slow treasury growth and yield; bull markets may amplify upside but also risk.
 - Mitigation: conservative base-case planning, risk limits, scenario-based allocations.
- NGO and local context risk
 - Missions in fragile regions can be delayed, disrupted or rendered unsafe.
 - Mitigation: diversified regional exposure, dynamic risk assessments, contingency planning, and flexible mission pipelines.
- Adoption and UX risk
 - If MiniApp UX or value proposition does not resonate, acquisition and retention may lag.
 - Mitigation: rapid UX iteration, strong user research, and an adaptable GTM strategy.

For each phase, the DAO and board maintain flexibility:

- to extend a phase if exit criteria are not yet met,
- to run limited “Phase N+1 experiments” while still consolidating Phase N,
- and to reallocate resources between missions, operations and reinvestment when conditions change.

9.6 Governance Migration Roadmap (Off-chain → On-chain)

Peace Soldiers adopts a phased approach to decentralised governance, moving gradually from off-chain signalling to fully on-chain, identity-bounded voting.

Phase 0 – Off-chain Pilot:

Early governance runs via off-chain tools (e.g., Snapshot-style signalling, structured discussions) mapped to Peace Passports and core stakeholders. This phase focuses on testing the decision-making model, refining PSIP formats and building a delegate registry without risking core contracts.

Phase 1 – Hybrid Governance:

Critical decisions (C1/C2-class proposals) are anchored on-chain, while some lower-impact or exploratory items still use off-chain signalling. The Security & Treasury Council and key subDAOs operate under clear on-chain mandates, term limits and recall rules. Identity-bounded voting starts to inform actual contract-level changes.

Phase 2 – Fully On-chain Governance:

The DAO transitions to on-chain, identity-bounded, token-capped voting as the primary decision-making mechanism. Council elections, subDAO mandates, key parameter updates and major treasury actions all pass through the on-chain governance program, with timelocks, receipts and adaptive shields fully active. Off-chain tools remain as complementary interfaces (UX, discussion, analytics), not as the core source of authority.

9.7. Governance of the Roadmap

The roadmap is not static; it is governed and updated like any other strategic asset.

- Parameter registry & milestones
 - Core targets (e.g., treasury bands, mission counts, Passport issuance) are captured in a parameter registry.
 - Changes to these targets require:
 - council proposals,
 - PS-DAO votes,
 - and on-chain receipts.

- Quarterly roadmap reviews
 - Each quarter, the core team and councils:
 - review progress vs. planned milestones,
 - update risk assessments and scenario models,
 - adjust GTM, NGO strategy and technical priorities.
 - Summary reports are published to:
 - the Board,
 - the DAO,
 - and, where appropriate, the public.
- Phase-transition resolutions
 - Moving formally from one phase to the next (e.g., Phase 1 → 2, 2 → 3) triggers:
 - a public resolution,
 - an update to the roadmap and parameter registry,
 - and potentially a recalibration of token emissions, budget envelopes and risk limits.

This ensures that the roadmap is transparent, auditable and adaptively governed – not just a slide in a pitch deck.

In summary, Section 9 lays out a deliberate path from prototype to global PeaceFi infrastructure: proving the rails, the missions, the economy and finally the model itself, with clear milestones and evidence at each step.

10. Organization & Team

Peace Soldiers is built as a lean, specialist core team supported by:

- a maturing DAO,
- an existing NGO backbone,
- and a network of external experts (security, legal, creative, dev agencies, RWA partners).

The design goal is to keep the organization:

- Small and focused at the center – ~8–12 FTE in Phases 1–2, growing only as the Peace Economy justifies it.
- Highly leveraged at the edges – via specialist partners and contributors who can be scaled up or down as needed.
- Aligned with the dual nature of the project – a serious NGO-rooted mission powered by fully Web3-native infrastructure.

The existing Peace Soldiers NGO and its network provide:

- Proven field experience in peace and humanitarian projects.
- A pipeline of NGOs and local partners for lighthouse and follow-on missions.
- A legitimacy layer and field credibility few Web3-native teams possess.

The protocol team, DAO and NGO are therefore designed to work as one system:

The NGO focuses on missions and people; the protocol focuses on rails, treasury and governance.

10.1. Operating Model

10.1.1. Lean Core, Rich Network

The core team is intentionally compact in Phases 1–2 (~8–12 FTEs), with roles concentrated in six critical areas:

- Product & Engineering – MiniApp, web, contracts, infra.
- Tokenomics & Treasury – financial design, allocations, risk, reporting.
- NGO Partnerships & Mission Operations – sourcing, due diligence, HII-aligned execution.
- Governance & DAO Operations – processes, proposals, parameter registry.
- Legal, Compliance & Risk – entity design, KYC/AML, regulatory watching.
- Marketing, Brand & Community – narrative, content, community growth.

Around this core, Peace Soldiers works with specialized external partners for:

- Smart contract and infra security audits.
- High-end design, visual identity and storytelling.
- Growth experiments and PR in priority regions.
- Legal and regulatory advisory in key jurisdictions.
- RWA / impact-finance structuring and treasury tooling.

This model:

- keeps fixed overhead low,
- gives access to top-tier capabilities on demand,
- and makes it easier to adapt to different phases, regions and regulatory environments.

10.1.2. Roles Across the “Three Layers”

The team is organized to mirror the three-layer product stack (Section 4), so every component has clear ownership.

User Layer – MiniApp, Web, Peace Store

- Product managers and UX/UI designers own the end-user experience.
- Frontend and mobile engineers build the MiniApp, dashboards and Store.
- Marketing & community ensure onboarding, messaging and campaigns are coherent.

Coordination Layer – Passports, Missions, HII, DAO

- Product + NGO operations co-design mission templates, HII logic and workflows.
- DAO operations run governance cycles, grants flows and the parameter registry.
- Data/analytics (within Product & Treasury) maintain HII and KPI dashboards.

Capital Layer – \$PEACE, Treasury, RWA

- Tokenomics and treasury specialists design allocations, scenarios and policies.
- Finance ops execute rebalancing, monitor positions and produce board-/DAO-grade reports.
- Legal & compliance ensure structural and regulatory soundness of instruments and partnerships.

This mapping ensures that:

- there is a direct line of responsibility from product components to business and impact outcomes,
- decisions are cross-functional, not siloed (e.g., missions always involve NGO + HII + treasury + governance),
- and the board can see who owns what across the stack.

10.1.3. Collaboration with Peace Soldiers NGO

The ecosystem consciously separates field work from protocol work, while aligning incentives.

- NGO / field operations
 - Run by Peace Soldiers NGO and partner NGOs.
 - Focus:
 - project design and local implementation,
 - relationships with communities and authorities,
 - staff safety and ethics,
 - field-level reporting and storytelling.
- Protocol / platform operations
 - Run by the protocol core team and DAO.
 - Focus:
 - treasury and token design,
 - MiniApp, HII and governance infrastructure,
 - platform-level risk, compliance and security,
 - ecosystem growth and partner integrations.

The NGO contributes:

- Field expertise and mission culture.
- On-the-ground staff and relationships.
- A pipeline of mission concepts and partners.

The protocol team contributes:

- Financial and treasury architecture (endowment-style design, scenario planning).
- Digital infrastructure (MiniApp, HII scoring, PS-DAO, dashboards).
- Global standards for reporting, identity and governance.

Over time, regional Peace Hubs (clusters of NGOs, practitioners, ambassadors and local partners) will handle more localized coordination, while the core protocol team remains focused on global standards, rails and risk.

10.1.4. Progressive Decentralization of Operations

Decentralization is treated as a trajectory, not a marketing slogan.

The model gradually hands more power to PS-DAO as systems prove themselves.

- Phase 1–2: “Rails & Missions”
 - Core team and councils hold most upgrade keys and treasury controls (secured via multisig and strict policies).
 - DAO has advisory and scoped powers:
 - signaling around missions and parameters,
 - initial governance experiments and small grants.
- Phase 3: “Economy”
 - DAO becomes the primary allocator of mission budgets within ranges defined by the parameter registry.
 - Councils (Treasury, NGO, Security, Legal/Risk) act as expert stewards with vetoes or co-approval rights on sensitive actions.
 - More upgrade powers and treasury parameters move on-chain under timelocked governance.
- Phase 4: “Global Reference”
 - DAO controls most strategic levers (mission envelopes, emissions ranges, RWA caps, Store policy guidelines).
 - The core team becomes more of a steward and delivery unit for the DAO than a centralized decision-maker.
 - Emergency brakes (e.g., kill switches, circuit breakers) remain, but are governed by constitutional processes.

This progression ensures decentralization is earned through demonstrated reliability and compliance, not rushed at the expense of safety.

10.1.5. Work Culture & Ways of Working

Peace Soldiers is remote-first and globally distributed, with hubs where needed for NGO and Peace Hub coordination.

Core operating practices:

- Documentation-first – specs, runbooks, decision logs and post-mortems are standard.
- Rhythms – clear weekly sprints, monthly reviews, and quarterly strategy checkpoints with councils and the Board.
- Shared dashboards – a single source of truth for:
 - mission pipeline and HII,
 - treasury and risk KPIs,
 - user and community growth,
 - governance participation.

Cultural values:

- Mission-first – capital and code exist to serve real communities, not vice versa.
- Evidence-driven – decisions anchor in data, experiments and HII scores.
- Security & compliance conscious – *“we don’t ship what we can’t explain to regulators, auditors or beneficiaries.”*
- Open collaboration – incentives and processes for external contributors, NGO partners and community members to shape the protocol.

This culture is critical to maintaining credibility with both NGOs and investors as the project scales.

10.2. Key Team Clusters

The operating model is expressed through seven core team clusters, each with a clear mandate, interfaces and outputs.

10.2.1. Product & Technology

Mandate: Build and maintain the PS MiniApp, web interfaces, smart contracts and integrations.

Core responsibilities:

- MiniApp product management and UX/UI design.
- Smart contract development (token, treasury, NFT, governance, HII hooks).
- Backend and infra (APIs, indexers, observability, analytics pipelines).
- Integrations with wallets, on-/off-ramps, oracles, and partner protocols.
- Performance, reliability, SLAs and incident response.

Key outputs: production-ready releases, technical documentation, uptime and reliability reports, integration playbooks.

10.2.2. Tokenomics & Treasury

Mandate: Design, simulate and execute token, treasury and financial policies.

Core responsibilities:

- Tokenomics modeling (supply, emissions, vesting, buybacks, incentive programs).
- Treasury allocation and rebalancing within DAO-approved risk limits (stables, LPs, staking, RWA pilots).
- Scenario analysis and stress tests (e.g., -50% market drawdowns, yield compression, liquidity shocks).
- Financial reporting to Board, DAO and external stakeholders (KPIs, WIR, coverage metrics).
- Interfaces with custodians, RWA platforms, market makers and institutional partners.

Key outputs: tokenomics specs, treasury policies, parameter registry entries, financial dashboards, quarterly and annual reports.

10.2.3. NGO & Partnerships

Mandate: Build and manage the ecosystem of NGOs, local partners and strategic collaborators.

Core responsibilities:

- NGO sourcing, due diligence and onboarding (docs, interviews, risk assessments).

- Co-design of mission proposals and HII-compatible KPIs.
- Monitoring execution, data collection and verification coordination.
- Relationships with global NGO networks, foundations and Peace Hubs.
- Strategic partnerships with Web3 protocols, ReFi/RWA projects, CSR/ESG partners and launchpads.

Key outputs: mission pipeline, partner MoUs, field reports, case studies and joint campaigns.

10.2.4. Governance & DAO Operations

Mandate: Design and run governance processes that make PS-DAO effective, not chaotic.

Core responsibilities:

- Governance framework maintenance (proposal types, quorums, timelocks, role definitions).
- Running and moderating governance forums; helping the community write clear, actionable proposals.
- Operating the Grants & Mission Funding workflow (intake → review → vote → disbursement → reporting).
- Maintaining the parameter registry and change log (what changed, when, by whom, why).
- Coordinating with councils (Treasury, NGO, Security, Legal/Risk) and external advisors.

Key outputs: orderly governance cycles, transparent records of decisions, predictable processes for contributors and NGOs.

10.2.5. Legal, Compliance & Risk

Mandate: Ensure Peace Soldiers can operate safely across jurisdictions and withstand regulatory and legal scrutiny.

Core responsibilities:

- Entity design and maintenance (Foundation, NGO, OpCo) and jurisdiction strategy.
- KYC/AML policies and vendor management (on-ramps, custodians, exchanges, RWA partners).

- Monitoring global regulatory developments (tokens, DAOs, NGOs, RWA/impact products).
- Maintaining a risk registry (market, operational, security, reputational, legal).
- Incident response frameworks and liaison with law firms, insurers and regulators where necessary.

Key outputs: compliant structures, documented policies, risk registers, legal memos backing key design choices.

10.2.6. Marketing, Communications & Community

Mandate: Tell the Peace Soldiers story, grow the community, and support user/NGO journeys.

Core responsibilities:

- Brand strategy, visual identity and core narratives.
- Content production (mission stories, explainers, videos, editorial pieces, thought leadership).
- Social channels, community support and ambassador programs.
- Launching and coordinating the Storytelling Syndicate and Peace Ambassadors (Section 8).
- Close collaboration with Product to craft in-app messaging, funnels and education.

10.2.7. QA, Security & External Audits

Mandate: Keep the system safe, resilient and trustworthy.

Core responsibilities:

- Internal QA for product releases (test plans, regression suites, acceptance criteria).
- Coordination with external security auditors (smart contracts, infra, treasury tooling).
- Operation of the Peace Bounty Network (bug bounties, vulnerability disclosure).

- Security monitoring and anomaly detection (e.g., suspicious mission patterns, treasury anomalies, governance irregularities).
- Security incident drills, post-mortems and remediation tracking.

Key outputs: audit reports, bug bounty summaries, security posture overviews, reliability metrics and remediation roadmaps.

11. Risk, Compliance & Governance

Peace Soldiers is explicitly designed as a risk-managed, audit-ready impact protocol. We are not trying to “outrun” risk; we are trying to price it, contain it and communicate it.

This section explains:

- how we think about risk as a system,
- the main risk categories and mitigations,
- the adaptive shields that automatically change behavior under stress,
- our compliance architecture, and
- the governance structure that ties all of this together.

11.1. Risk Philosophy

The project treats the treasury as an endowment for peace, not a speculative pool, and treats missions as deliberate investments in human outcomes, not marketing campaigns.

Principles:

1. Preserve the engine
 - The first duty of risk management is to keep the treasury and protocol alive so missions can continue, even during crises.
2. Fund missions from strength, not desperation

- Missions are primarily funded from yield and recurring revenues, within clearly defined bands.
 - When conditions deteriorate, we reduce mission growth or risk exposure before the engine is damaged.
3. No “black box” risk
- Every major risk has a named owner, metrics, thresholds and response options.
 - Stakeholders (Board, DAO, NGOs, investors) can see how risk is being monitored and managed.
4. Field safety and ethics first
- No financial or on-chain objective overrides the obligation to protect communities, staff and beneficiaries.
5. Regulation-aware, not regulation-averse
- We seek jurisdictionally sound structures and conservative interpretations where there is uncertainty, especially around tokens, RWAs and cross-border funding.

The result: a system where risk is visible, parameterized and acted upon, rather than an afterthought.

11.2. Key Risk Categories & Mitigations

We categorize risk into six main buckets.

(For board presentations, these can be visualized as a likelihood vs impact matrix, with top-priority items highlighted.)

11.2.1. Market & Liquidity Risk

What can go wrong?

- Prolonged bear markets reducing treasury value, yields and token price.
- Sharp volatility around token events, listing news or macro shocks.
- Insufficient liquidity on DEX/CEX leading to severe slippage or price manipulation.

Mitigations

- Conservative base case: planning around a 30–40M USD treasury and ~9–10% net APY using diversified, mostly low–mid risk strategies.
- Allocation limits:
 - caps per asset, protocol and strategy,
 - guardrails on LP exposure and leverage (if any).
- Coverage metrics:
 - “months of operational runway” and “mission budget coverage” tracked at all times.
- Liquidity management:
 - dedicated liquidity bucket (5% supply),
 - aligned market makers where appropriate,
 - locked LP positions and clear unlock profiles.
- Scenario testing:
 - regular stress tests (e.g., -50% market shock, yield compression, liquidity drought) feeding into the parameter registry and adaptive shields.

11.2.2. Protocol & Technical Risk

What can go wrong?

- Smart contract vulnerabilities leading to loss or freeze of funds.
- MiniApp or web stack compromises (phishing, session hijacking, data leaks).
- Oracle issues or infrastructure outages affecting mission or treasury operations.

Mitigations

- Security-by-design:
 - use of audited libraries and widely used patterns for token, treasury and NFT contracts,
 - minimal on-chain complexity for early versions; progressive feature roll-out.
- External audits & bug bounties:
 - all critical contracts audited by reputable firms before mainnet use,
 - ongoing bug bounty program with clear disclosure processes.
- Defense-in-depth:
 - multisig-controlled upgrade paths and emergency pause mechanisms,
 - separation of concerns (treasury vaults, mission contracts, governance modules).
- Infra redundancy:
 - multiple RPC/infrastructure providers,
 - monitoring, alerting and failover procedures for nodes and APIs.

11.2.3. Counterparty & RWA Risk

What can go wrong?

- Failure or misconduct by DeFi protocols, centralized custodians or RWA issuers.
- Mispriced or illiquid RWAs, especially in fragile or emerging markets.
- Legal or enforcement actions affecting access to assets.

Mitigations

- Tiered counterparty framework:
 - clear criteria for onboarding yield/RWA partners,

- due diligence on governance, regulation, audits and track record.
- Concentration limits:
 - hard caps per counterparty and per RWA class (e.g., “up to ~30% of treasury in RWA, with sub-limits per instrument”).
- Collateralization and structure:
 - preference for overcollateralized or strongly structured positions where feasible,
 - focus on regulated or highly reputable platforms.
- Legal wrappers & jurisdiction strategy:
 - RWA exposure housed in entities/structures selected with specialist counsel,
 - clear contractual rights and recourse in agreements.

RWA allocations are introduced gradually in Phase 2–3, not front-loaded.

11.2.4. Regulatory & Legal Risk

What can go wrong?

- Changes in laws or guidance around tokens, DAOs, RWAs or NGOs.
- Misinterpretation of \$PEACE as an unregistered security in certain jurisdictions.
- Cross-border sanctions, KYC/AML failures or travel rule violations via partners.

Mitigations

- Compliance-by-design architecture (see 11.3):
 - Foundation + NGO + OpCo structure,
 - clear separation between protocol, NGO operations and legal entities.
- Utility-token positioning for \$PEACE:
 - documented use as governance + utility, no profit/dividend promises,

- jurisdiction-specific restrictions (e.g., geo-fencing or KYC gating) where needed.
- Vendor and partner due diligence:
 - KYC/AML-screened on-/off-ramps, exchanges and custodians,
 - monitoring of sanctions lists and high-risk jurisdiction exposures.
- Continuous legal monitoring:
 - relationships with external law firms and compliance advisors,
 - periodic reviews of whitepaper, BP, TGE docs, T&Cs and marketing materials.

11.2.5. Operational, NGO & Mission Risk

What can go wrong?

- Missions fail, underperform or misreport; local partners misuse funds.
- Staff safety incidents or local political developments disrupt operations.
- Data collection for HII is incomplete, biased or falsified.

Mitigations

- NGO due diligence & staged onboarding:
 - legal status, governance, financial controls, reputation checks, field references.
- Tranche-based disbursements:
 - missions funded in stages, with milestones tied to evidence and HII inputs.
- HII & verification:
 - standardized indicators, cross-checks, and third-party attestations where possible.
- Field risk protocols:
 - guidelines for staff safety, conflict sensitivity and do-no-harm principles (aligned with NGO best practices).

- Portfolio diversification:
 - missions distributed across regions, themes and partners to avoid over-concentration.

11.2.6. Governance, Reputational & ESG Risk

What can go wrong?

- DAO capture by small groups or misaligned actors.
- Conflicts between protocol and NGO values (e.g., questionable partners or campaigns).
- Public perception that Peace Soldiers is speculative, extractive or politically biased.

Mitigations

- Hybrid governance:
 - PS-DAO + expert councils + legal entities, each with defined mandates and checks & balances.
- Identity-bounded voting:
 - Peace Passports and caps per identity to reduce pure plutocracy and Sybil risk.
- Code of conduct & partner policy:
 - explicit exclusions (e.g. hate groups, extremist agendas),
 - brand and ethics guidelines for missions and partnerships.
- Transparent communications:
 - regular impact reports, financial reports and governance summaries,
 - clear response plans for incidents or mistakes (acknowledge, remediate, learn).

11.2.7 Governance Overload & Voter Apathy

Description: As the number of PSIPs, council reviews and subDAO reports grows, voters may become overloaded or disengaged. Over time, this can lead to low turnout, rubber-stamping of complex proposals, and de facto centralisation of power around a small circle of highly active participants.

Mitigation: (1) A governance Gateway filters, rate-limits and bundles proposals to avoid noise; (2) a public delegate registry encourages voters to delegate to trusted stewards; (3) PSIPs are scheduled and grouped to minimise voting fatigue; (4) concentration and participation KPIs (Herfindahl index, Gini index, turnout per proposal, delegate share) are monitored and reported; (5) if thresholds are breached, the DAO can trigger corrective measures such as temporary proposal caps or mandatory advisory periods.

11.3. Compliance Architecture

Peace Soldiers' compliance design is modular and jurisdiction-aware, balancing NGO operations with a global protocol.

11.3.1. Entity & Role Separation

At a high level:

- Foundation / Protocol Entity
 - Holds IP, oversees protocol roadmap, manages key service contracts.
 - Interfaces with PS-DAO and ensures that legal and fiduciary obligations are met.
- Peace Soldiers NGO & Local NGOs
 - Lead field operations, local hiring, beneficiary engagement and mission execution.
 - Operate under charities/non-profit regulations of their jurisdictions.
- Operating Company (OpCo)
 - Provides development, marketing and operations services to the Foundation and NGO.
 - Employs staff and manages day-to-day operations where appropriate.

This separation:

- clarifies which entity is responsible for code, capital and contracts,
- protects mission operations from purely token-market volatility,
- makes regulatory and tax compliance more manageable.

11.3.2. KYC/AML, Sanctions & Data Protection

- KYC/AML

- Required for certain cohorts and use cases (e.g., fiat on-ramps, institutional investors, RWA participants), via regulated providers.
- Risk-based approach for smaller crypto-native contributions, balancing compliance and accessibility.
- Sanctions & high-risk jurisdictions
 - Use of screening tools and policies to avoid direct or indirect flows to sanctioned entities or restricted regions.
 - NGO partnerships in fragile regions structured carefully, with enhanced due diligence and monitoring.
- Data protection & privacy
 - Minimal personal data collected within the protocol when possible.
 - Strong focus on data minimization and encryption for mission and beneficiary data.
 - Compliance with relevant data protection laws (e.g., GDPR-like regimes) where applicable.

The system distinguishes between:

- On-chain transparency (flows of funds, governance decisions, HII scores), and
- Off-chain privacy (personal identities, sensitive mission details) handled by NGOs and partners with appropriate safeguards.

11.3.3. Token & TGE Compliance

Key guidelines for token and launch events:

- Clear economic design & disclosures
 - Public documentation (whitepaper, BP, tokenomics) explaining utility, risks and non-equity nature of \$PEACE.
 - Jurisdiction-appropriate disclaimers and eligibility criteria.
- Jurisdiction-specific restrictions
 - Exclusion or special requirements for users from certain high-risk or heavily regulated markets, following counsel advice.
- Travel Rule & custody considerations

- Partnering with exchanges/custodians prepared for Travel Rule obligations.
- Clear boundaries between self-custody MiniApp flows and third-party custodial services.

This ensures token and TGE activities are as compliant as reasonably achievable under evolving regulation.

11.4. Adaptive Shields – Triggers & Automated Responses

“Adaptive shields” are pre-defined, rule-based responses that reduce risk when specific metrics cross thresholds.

They are the bridge between risk monitoring and automatic or fast governance action.

Suggested visual: Flowchart:

Metrics → Trigger zone (Green / Amber / Red) → Actions (automatic + governance review).

11.4.1. Shield Layers & Zones

We use a three-zone model:

- Green – normal conditions; full operations and mission growth.
- Amber – moderate stress; controlled slowdown and heightened monitoring.
- Red – severe stress; capital protection and minimal mission/expansion spending.

Example metrics monitored:

- Treasury coverage (e.g., months of runway and mission capacity).
- Net APY vs base assumptions.
- Liquidity depth (DEX/CEX) and volatility.
- Concentration in any single asset, protocol or RWA.
- HII performance and operational incident rates.

Each metric has:

- Green → Amber threshold(s) (warning),
- Amber → Red threshold(s) (critical),
- re-entry conditions (to move back from Red/Amber to safer zones).

11.4.2. Example Shields

Shield A – Treasury Health

- Trigger metric: “Coverage Months” (operational + mission budgets covered by liquid reserves + yield).
- Green: ≥ 18 months
 - Normal mission budgeting and moderate expansion.
- Amber: 12–18 months
 - *Automatic adjustments:*
 - slow mission budget growth (e.g., +X% cap per year),
 - pause low-priority experiments.
 - *Governance review:*
 - councils review allocations and rebalancing; DAO consulted.
- Red: < 12 months
 - *Automatic:*
 - freeze mission budget growth,
 - increase reinvestment rate,
 - move treasury to safer allocation bands.
 - *Governance:*
 - emergency review, optional use of contingency reserves,
 - communication to board and community with remedial plan.

Shield B – Market & Liquidity

- Trigger metrics: token volatility, 24h/7d liquidity depth, order-book health on major venues.
- Green: normal volatility, deep liquidity around key price bands.
- Amber: elevated volatility, thinning liquidity
 - Slow or halt buybacks,
 - increase emphasis on LP incentives instead of direct market actions.
- Red: severe illiquidity or market dislocation
 - Suspend non-essential treasury trades,
 - temporarily pause new emissions programs or experiments that add sell pressure,
 - move more assets into stables and high-liquidity positions.

Shield C – RWA & Counterparty

- Trigger metrics: concentration in a single RWA issuer/platform, counterparty events, impairment indicators.
- Green: within diversification limits, no critical events.
- Amber: approaching caps or early warning signs from counterparties
 - stop new RWA exposure to that issuer,
 - rebalance gradually away from heightened risk.
- Red: default, severe impairment or enforcement action
 - freeze all new RWA exposure,
 - prioritize capital recovery and legal response,
 - revert to purely crypto/stable strategies until situation is resolved.

Shield D – Mission & NGO

- Trigger metrics: HII distribution, mission failure rates, serious incidents or ethical breaches.
- Green: majority of missions $\geq 70/100$ HII, low incident rates.
- Amber: rising share of low-HII missions or concerning incidents
 - slow funding for underperforming NGOs/regions,

- tighten due diligence and verification requirements.
- Red: severe misuse of funds, repeated safety or ethics issues
 - suspend mission funding for affected NGO/region,
 - independent investigation and remediation,
 - public communication and updated guidelines.

These shields are codified in the parameter registry, with:

- clear thresholds,
- defined automatic responses,
- and required governance actions.

They make risk management predictable, transparent and pre-committed, reducing the risk of ad-hoc or emotional decisions under pressure.

11.5. Governance Structure & Accountability

Risk and compliance are only as strong as the governance that enforces them.

11.5.1. Governance Layers

Peace Soldiers governance is multi-layered:

1. Foundation Board

- Ultimate legal responsibility over the protocol entities.
- Approves major structural decisions (e.g., jurisdiction changes, mergers, dissolution).
- Ensures that PS-DAO decisions remain within legal and fiduciary constraints.

2. Councils (Treasury, NGO, Security, Legal/Risk)

- Expert committees with delegated authority and veto powers in their domains.
- Propose and review:
 - risk parameters,
 - mission and NGO decisions,
 - treasury allocations,
 - security changes and upgrades.

3. PS-DAO

- Token + identity-bounded governance body.

- Votes on:
 - parameter ranges, budgets, emissions policies,
 - upgrades, integration priorities,
 - grants and community programs.

4. Community & NGOs

- Provide proposals, feedback, and signal.
- Hold the DAO and councils accountable via public debate and off-chain forums.

Decision rights are carefully mapped and documented (RACI-style) so everyone knows:

- who can propose,
- who must review,
- who can approve/veto,
- and how changes are enacted.

11.5.2. Transparency & Reporting

To maintain trust, reporting is regular and multi-channel:

- Quarterly Financial Reports
 - Treasury composition, yield, mission and operations budgets, reinvestment, coverage metrics.
- Quarterly Impact Reports
 - Missions funded, HII scores, stories from the field, lessons learned.
- Annual Governance Review
 - Key parameter changes, DAO participation statistics, council activities, major resolutions.
- Audit Reports
 - Smart-contract security audits, treasury security reviews, and, where feasible, financial statement reviews.

All reports are designed to be:

- understandable for boards, NGOs and regulators,
- detailed enough for crypto-native and institutional analysts,
- and backed by on-chain data where possible.

11.5.3. Incident Management & Escalation

When things go wrong, the protocol has clear escalation paths:

- Technical incidents (e.g., bugs, exploits)
 - immediate activation of incident response playbooks,
 - temporary pauses or circuit breakers where required,
 - coordination with security partners and exchanges.
- Mission or NGO incidents (e.g., misuse of funds, ethics issues)
 - pause funding for affected missions,
 - investigate with NGOs and local partners,
 - notify relevant stakeholders and, if necessary, authorities.
- Regulatory or legal incidents
 - rapid consultation with counsel,
 - assessment of exposure,
 - interim steps (e.g., geo-fencing, product changes) to contain risk.

Post-incident:

- Post-mortem reports are prepared, with:
 - root cause analysis,
 - impact assessment (financial, operational, reputational),
 - remediation steps and timeline.
- These are shared with:
 - Board,
 - PS-DAO and community (with necessary redactions for safety and privacy),
 - key partners where relevant.

This closes the loop between risk events, learning and governance, ensuring the system becomes more robust over time.

In summary, Section 11 shows that Peace Soldiers is not only ambitious in impact, but serious about risk, compliance and governance:

- Risks are identified and owned,
- Compliance is an integral part of the architecture,
- And governance is structured to be identity-aware, expert-informed and transparently accountable.

12. Investment Ask & Use of Funds

Peace Soldiers is designed as a treasury-first, impact-first ecosystem.
The investment ask is therefore not:

“Raise as much as possible and see what happens,”

but:

Raise only the capital the system can deploy transparently and productively,
to build a long-lived *Peace Treasury* rather than a one-time charity campaign.

This section explains:

- how the capital raise is structured,
- which treasury size bands (conservative / base / upside) we are targeting, and
- how funds are allocated, phased and governed during the first roadmap cycles.

12.1. Capital Raise – Structure & Targets

12.1.1. Funding Philosophy

The funding strategy follows the Impact Financing Framework (IFF) defined in the Investor & Launch Package and can be summarized in four rules:

1. Raise in stages, not in one shot
 - Each stage is synchronized with delivery milestones (product, missions, governance) and market conditions.

- Capital is unlocked as we prove the next layer of the Peace Wealth Cycle.
- 2. Wire capital into a transparent treasury, not opaque accounts
 - Capital is aggregated into an on-chain, auditable treasury with clear reporting, rather than being scattered across bank accounts and ad-hoc wallets.
- 3. Fund missions from yield, preserve principal wherever possible
 - Proceeds are used to build a diversified, yield-generating Peace Treasury.
 - Missions are funded primarily from yield + ecosystem revenues, preserving principal for the long run.
- 4. Curate a mission-aligned investor base
 - We prioritize investors and partners who:
 - understand endowment-style models,
 - are comfortable with modest, realistic returns, and
 - value verifiable peace impact as part of their outcome stack.

In practice, this means combining:

- Private strategic capital (to anchor treasury, build rails, de-risk RWA / compliance),
- a carefully structured public launch / IDO (to expand ownership and deep liquidity), and
- non-dilutive flows (NFTs, grants, Peace Store revenues) that support operations and growth without inflating token supply or undermining the treasury.

12.1.2. Round Structure & Instruments

We anticipate a multi-instrument, staged raise, aligned with the phases in Section 9.

Private Strategic Round

- Target: $\approx$ \$5–8M
- Participants:

- impact-oriented funds,
- Web3 / ReFi funds,
- family offices and high-net-worth individuals aligned with peace outcomes.
- Use of proceeds:
 - build the Phase 1–2 rails (MiniApp, HII v1, core contracts),
 - establish the initial Peace Treasury in the conservative band ($\geq \$10M$ where feasible),
 - fund legal/compliance setup, audits and early NGO pilots.
- Instruments:
 - equity and/or token rights (SAFT framework) depending on jurisdiction,
 - with vesting and milestone-gated unlocks to align long-term commitment.

Public Token Event(s) – IDO / Launchpad

- Objective:
 - broaden community ownership of \$PEACE,
 - deepen liquidity,
 - and top up the Peace Treasury toward the base band (30–40M) over time.
- Design principles:
 - conservative caps and vesting to avoid dump cycles,
 - clearly disclosed allocation (treasury, community incentives, liquidity),
 - compliance-aware structures (geo-fencing / KYC where required).

Genesis NFT Sale

- Asset: 10,000 Genesis Peace Soldier NFTs.

- Role:
 - non-dilutive capital source for:
 - community incentives,
 - content/storytelling,
 - NGO onboarding and mission documentation.
 - symbolic “founding cohort” identity with no equity-like rights.
- Use of proceeds (high-level):
 - partial contribution to the treasury,
 - partial allocation to growth + mission content budgets,
 - partial allocation to ongoing product and community work.

Grants & Ecosystem Programs

- Grants from:
 - Web3 ecosystems (e.g., Solana / ReFi initiatives),
 - philanthropic foundations,
 - innovation funds.
- Focused on:
 - HII tooling,
 - governance frameworks,
 - Peace Hub pilots,
 - technical audits and security infrastructure.

Combined, the core capital raise target is in the range of ≈\$20–25M in liquid assets (fiat + crypto), plus non-dilutive contributions from NFTs and grants, representing ~12% of total token supply when mapped via token sales.

This is deliberately modest compared to 2021–2022 “hyper-raises”: it is sized to match the realistic mission pipeline and the lean operating model described in Sections 6–10.

12.1.3. Treasury Size Scenarios (Conservative / Base / Upside)

To give boards and investors a clear mental model, we define three target treasury bands. These are planning scenarios, not promises:

1. Conservative path

- Treasury: $\approx$ \$10–15M
- Outcome:
 - solid pilot / proof-of-concept scale,
 - 5–8 missions per year at \$150–250k once ramped,
 - emphasis on risk management, learning and data.

2. Base path (primary target)

- Treasury: $\approx$ \$30–40M via staged private + public rounds and NFT / Store revenues.
- Financial behavior:
 - net APY target around $\sim$ 9–10%,
 - annual yield of $\approx$ \$3–4M,
 - 15–20 missions per year at significant scale,
 - principal preserved and modestly compounded.

3. Upside path (aspirational)

- Treasury: $\approx$ \$50–100M after successful execution, strong IDO, RWA/Peace Bond adoption and ecosystem growth.
- Financial behavior:
 - effective returns up to $\sim$ 12–15% in favorable conditions (RWA performance, Peace Store upside, launch-related inflows),

- supports 20+ missions per year,
- allows heavier investment in innovation (advanced HII analytics, global Peace Hubs, R&D).

In all cases, the logic is identical:

Capital → Treasury → Yield → Missions → HII → Stronger brand & demand →
More capital → Stronger treasury → More missions.

The only difference across scenarios is scale and speed, not the underlying design.

12.2. Use of Funds – Base Case Allocation

At full raise (≈\$20–25M), the indicative use of funds is:

- ~40% → Treasury for Missions & Yield Strategies
- ~25% → Community, Growth & Incentives
- ~15% → Liquidity & Listings (DEX/CEX)
- ~10% → Operations, Tech & Product
- ~10% → Legal, Compliance, Audits, Security & Reserve

This is a policy envelope, not a rigid rule. The DAO and Board may adjust within tight ranges, but any major deviation must be justified, voted and documented.

12.2.1. ~40% – Treasury for Missions & Yield Strategies

Purpose

Anchor a long-lived, yield-generating Peace Treasury that can fund missions for 20+ years under conservative assumptions.

Use

- Allocate capital into the base treasury strategy (see Section 7):
 - ≈ 40% stablecoin yield pools (≈8% APY target),

- $\approx$ 40% \$PEACE/SOL & related LP positions ($\approx$ 12% APY target, carefully risk-managed),
- $\approx$ 15% blue-chip staking ($\approx$ 10% APY),
- $\approx$ 5% operational cash buffer.
- Over Phases 2–3, progressively carve out up to $\sim$ 30% of the treasury into impact-aligned RWA positions (microfinance, Peace Bonds, social-impact instruments) as legal, partner and risk work is completed.

Why this matters

This is the engine of the Peace Economy. Without a well-capitalized, disciplined treasury:

- mission funding remains dependent on donations and new raises,
- long-term planning (multi-year programs, Peace Hubs) becomes impossible,
- the Peace Soldiers protocol would behave like a campaign, not an endowment.

12.2.2. $\sim$ 25% – Community, Growth & Incentives

Purpose

Transform a strong financial engine into a living ecosystem of users, NGOs, creators and partners.

Use

- MiniApp & Peace Passport growth programs:
 - user acquisition, education and starter quests,
 - translation and localization for key regions.
- Ecosystem incentives:
 - \$PEACE reward programs for missions, contributors, verifiers and DAO participation,
 - strategic grants for integrations (wallets, launchpads, ReFi partners).
- Storytelling and brand:

- Peace Ambassadors, Storytelling Syndicate, video and editorial coverage of lighthouse missions,
- campaigns tying the Peace Store to specific missions and HII outcomes.

Why this matters

Peace Soldiers is not a passive endowment; it is a network.

Without dedicated growth and incentive budgets, the Peace Wealth Cycle:

Missions → HII → Treasury → More missions

would spin too slowly, leaving the treasury under-utilized and the story under-told.

12.2.3. ~15% – Liquidity & Listings (DEX/CEX)

Purpose

Ensure healthy, predictable markets for \$PEACE so that stakeholders (donors, investors, NGOs, contributors) can enter and exit positions without destabilizing the ecosystem.

Use

- Seed and lock DEX liquidity on major Solana DEXs for ≥ 12 months:
 - reduce early thin-market volatility,
 - provide price discovery anchored in real participation,
 - support integrations with DeFi and ReFi partners.
- Finance initial CEX listings and market-making where appropriate:
 - tight spreads,
 - adequate depth,
 - compliance-compatible on/off-ramps for institutional and retail users.

Why this matters

Even the best tokenomics can fail if liquidity is weak.

Shallow markets:

- amplify volatility,
- create opportunities for manipulation,
- and undermine the trust of NGOs, donors and regulators who need consistent pricing and exit options.

12.2.4. ~10% – Operations, Tech & Product

Purpose

Fund the lean core team and technical infrastructure required to keep the protocol safe, functional and evolving.

Use

- Core team salaries (product, engineering, NGO ops, governance, treasury, community).
- Infrastructure (RPC, indexers, monitoring, analytics, storage).
- Continuous product improvements:
 - MiniApp features and UX,
 - HII tooling and dashboards,
 - Peace Store integrations,
 - governance and analytics interfaces.

Why this matters

Without a well-resourced, small but high-caliber core, the protocol cannot:

- ship the roadmap on time,
- maintain security and uptime,
- or support NGOs and partners in the field.

The target is to keep Ops & Tech lean relative to yield and mission budgets, monitored via “Operations & Governance Spend / Total Yield & Revenues” (Section 6).

12.2.5. ~10% – Legal, Compliance, Audits, Security & Reserve

Purpose

Create a defensible, audit-ready foundation capable of handling tens of millions in capital and operating in sensitive regions.

Use

- Legal structuring and ongoing counsel (Foundation / NGO / OpCo; RWA / impact products).
- KYC/AML, sanctions screening and compliance tooling.
- Smart contract and financial audits, plus periodic re-audits.
- Security stack:
 - monitoring, key management, threat detection, bug bounty programs.
- Reserve buffer for regulatory and operational surprises.

Why this matters

Cutting corners on legal and security is not compatible with handling a large, mission-critical treasury.

This budget is also what enables:

- RWA and Peace Bond experiments,
- institutional partnerships,
- and long-term sustainability under increasing regulatory scrutiny

12.2.6. Network Operations & Gas Buffer ($\approx 1\text{--}2\%$)

A dedicated reserve for on-chain operational costs over the first 24–36 months, including transaction fees for treasury rebalancing, mission payouts, buyback and burn when enabled, LP management, and DAO execution calls. This fund ensures that core protocol operations and governance actions remain reliable and affordable even under network congestion or fee spikes.

12.2.7. Identity & KYC-light Operations

Peace Soldiers relies on identity-bounded governance and the Human Impact Index (HII) to maintain both integrity and regulatory hygiene. To make this sustainable, the project dedicates an explicit budget line to “Identity & KYC-light Operations” within the Legal & Compliance envelope. This covers per-user and per-organisation costs for identity verification, sanctions screening and basic KYC-light checks, together with the infrastructure required to store and process HII-related data in a privacy-conscious way. The DAO monitors the cost per verified user

and per mission and can adjust thresholds, verification levels and vendor choices in response to growth, risk and regulatory context.

Within the Legal, Compliance, Audits & Reserve envelope, a dedicated “Identity & KYC-light Operations” budget covers the ongoing costs of user and NGO verification, sanctions screening, and HII-related data stewardship. This ensures that identity-bounded governance and impact measurement remain financially sustainable and compliant as the number of Peace Passport holders and missions grows.

12.3. Phasing of Deployment

Funds are not deployed all at once. They are phased alongside the 4-phase roadmap (Section 9) and TGE/IDO gates.

Phase 1 – Infrastructure & IDO (Months 0–6)

- Deploy only the minimum treasury capital needed to start yield strategies safely and seed initial liquidity.
- Prioritize:
 - audits and security posture,
 - MiniApp MVP and core contracts,
 - initial NGO pipeline preparation.
- Keep growth and incentives modest, focusing on early adopters and core communities.

Phase 2 – Pilots & Validation (Months 6–12)

- Increase mission budgets funded primarily from yield, plus dedicated NGO support grants.
- Direct more of the growth budget to:
 - lighthouse missions,
 - Peace Passports,
 - storytelling around early successes and learnings.
- Gradually increase DEX liquidity and consider first CEX listings if justified.

Phase 3 – Economy Scale-Up (Months 12–26)

- Scale treasury toward 30–40M USD base band as conditions allow.
- Expand mission budgets to 15–20 missions/year, financed from yield + Peace Store + co-funding.
- Activate RWA / Peace Bond pilots within conservative caps.
- Increase growth and community budgets to consolidate network effects.

Phase 4 – Global Reference (26+ months)

- Reinvest large share of surplus into:
 - global Peace Hubs,
 - advanced HII analytics and tooling,
 - institutional partnerships.
- Maintain disciplined allocation ranges; use upside to deepen resilience rather than only enlarging surface area.

At each phase, deployment is gated by evidence, not just time:
treasury health, mission performance, HII quality, governance maturity and regulatory clarity.

12.4. Governance of Capital & Investor Protections

Capital use is governed through pre-committed rules, councils and DAO oversight, not ad-hoc decisions.

Key mechanisms

- Parameter registry
 - Encodes target ranges for:
 - treasury allocations,
 - mission budgets,
 - emissions,
 - coverage months,

- allocation caps (e.g., RWA max ~30%).
 - Any changes require multi-step governance (council review + DAO vote + timelock).
- Treasury & Risk Councils
 - Expert groups with delegated authority and veto powers over:
 - high-risk allocations,
 - RWA onboarding,
 - exceptional use of principal.
 - Provide technical recommendations to PS-DAO and the Board.
- Adaptive shields (Section 11)
 - Scenario-triggered safeguards that automatically:
 - slow or pause certain emissions programs,
 - adjust mission budgets,
 - reduce RWA exposure,
 - or tighten liquidity actions when metrics cross Amber/Red thresholds (e.g., APY collapse, coverage months falling, extreme volatility).
- Transparency & reporting
 - Quarterly and annual reports detailing:
 - treasury positions and yields,
 - mission flows and HII scores,
 - use-of-funds vs the original 40/25/15/10/10 envelope.
 - On-chain dashboards illustrating flows and balances in near real time.

For investors, protections are principle-based:

- capital is ring-fenced into a transparent treasury,
- mission funding is tied to performance and HII,
- treasury risk is bounded by explicit policies,
- and any deviations from the capital plan are visible, debated and voted.

12.5. Investor Takeaways

For board members and investors, Section 12 can be summarized in five points:

1. Staged, realistic raise
 - Raise ≈\$20–25M in a staged manner, building toward treasury bands of \$10–15M (conservative), \$30–40M (base) and \$50–100M (upside) over time.
2. Treasury-first allocation
 - The use of funds is treasury-centric (~40%) and growth-credible (~25%), with disciplined budgets for liquidity (~15%), operations (~10%) and compliance/security (~10%).
3. Endowment-style economics
 - The model is designed to behave like an impact endowment:
 - funding missions from yield + revenues,
 - preserving and compounding principal,
 - with clear scenarios and risk shields, not vague promises.
4. Institutional compatibility
 - Structures, allocations and controls are compatible with institutional expectations:
 - documented risk framework,
 - audits and compliance budgets,
 - scenario analysis and adaptive safeguards.

5. Direct mapping into the Peace Wealth Cycle

Every dollar raised has a clear narrative and data trail:

Capital raised

- Treasury yield & ecosystem revenues
- HII-verified missions
- Impact stories & NGO credibility
- Stronger brand, more users & donors
- More capital and yield
- A stronger, more resilient Peace Treasury.

In short, the Investment Ask & Use of Funds are designed so that financial discipline and peace impact reinforce each other, rather than competing for attention.

13. KPIs & Impact Measurement

Peace Soldiers is not only a funding protocol; it is an evidence engine for peace.

From day one, we measure whether:

- money actually reaches communities,
- missions create real, durable improvements, and
- the Peace Wealth Cycle is working as designed.

This section explains:

- the KPI stack we track,
- how the Human Impact Index (HII) is constructed and used,
- how the Wealth Impact Ratio (WIR) connects financial performance to human outcomes,
- and how data flows into dashboards and governance.

13.1. Measurement Philosophy

We treat measurement as part of the product, not an afterthought.

Principles:

1. Few metrics, used deeply
 - A focused set of KPIs that are tracked, debated and acted on, rather than dozens of vanity metrics.
2. Comparable over time and across missions
 - HII and key KPIs are standardized, so we can compare missions in different regions and themes.
3. Interpretable by humans, computable by machines
 - Indicators and formulas are:
 - simple enough for boards, NGOs and regulators to understand,
 - structured enough for dashboards, audits and algorithms.
4. Aligned with funding and governance
 - KPIs are not just “nice to have”; they drive budget decisions, mission tiering and incentive programs.
5. Respectful of context and safety
 - We collect only the data we really need, with strong privacy and conflict-sensitivity in fragile contexts.

13.2. KPI Stack – What We Measure

We group KPIs into four families.

(For slides, this can be shown as a 2×2 matrix or a simple table.)

Family	Focus	Examples (headline metrics)
Impact (Mission & HII)	Outcomes for people & communities	HII, #beneficiaries, missions/year, HII $\geq$ 75% share
Financial & Treasury	Engine health & sustainability	Treasury size, net APY, coverage months, WIR
Ecosystem & Growth	Users, NGOs, partners, activity	Passports, MAU, NGOs onboarded, Store GMV
Governance & Risk	Decision quality, safety & resilience	DAO participation, risk indicators, incidents resolved

13.2.1. Impact KPIs (Mission & HII)

These answer: “Are we making meaningful, verifiable peace impact?”

Core metrics:

- Number of missions funded and completed per year
 - By theme (education, water, reconciliation, youth, women & children),
 - By region (MENA, Africa, Eastern Europe, etc.).
- Beneficiaries reached
 - Direct and indirect beneficiaries, with documented assumptions.
- Average and distribution of HII scores
 - Median HII across missions in a given year,
 - % of missions scoring:

- $\geq 85/100$ (excellent),
 - $70-84/100$ (strong),
 - $< 70/100$ (needs improvement).
- Mission durability & follow-up
 - % of missions with follow-up checks after 6–18 months,
 - HII “stability” (how much scores change over time).

These metrics become the primary lens for NGO and mission evaluation.

13.2.2. Financial & Treasury KPIs

These answer: “Can the engine keep funding peace for 20+ years?”

Core metrics (see Sections 6–7):

- Treasury size (USD equivalent and composition by asset class).
- Net APY (after fees, haircuts and risk buffers).
- Coverage months (how many months of mission budget + operations are covered by liquid reserves and yield).
- Wealth Impact Ratio (WIR) – linking wealth trajectory to human impact (see 13.4).
- Concentration & risk indicators (largest positions, RWA share, protocol/counterparty exposure).

These metrics allow the Board, DAO and investors to see if the treasury is behaving like an endowment, not a trading desk.

13.2.3. Ecosystem & Growth KPIs

These answer: “Is the Peace Economy actually forming?”

Core metrics:

- Peace Passports issued and active.
- Monthly active users (MAU) in MiniApp and web.

- User funnel metrics:
 - Awareness → MiniApp open → Passport claim → First mission support → Repeat support.
- NGO and partner metrics:
 - of NGOs onboarded,
 - of active Peace Hubs,
 - of corporate / ReFi / RWA partners.
- Peace Store KPIs:
 - GMV, net revenue, % linked directly to missions or Redistribution Pool.

These KPIs show whether Peace Soldiers is becoming a living ecosystem rather than a static funding mechanism.

13.2.4. Governance & Risk KPIs

These answer: “Is the system governable, safe and credible?”

Core metrics:

- DAO participation:
 - % of eligible addresses or Passports participating in at least one vote per quarter,
 - turnout on major proposals.
- Governance health:
 - number of proposals passed / rejected,
 - time-to-decision,
 - share of proposals originating from community vs core team.
- Risk indicators:

- count and severity of security incidents,
- time-to-detect and time-to-mitigate,
- “shield status” (Green / Amber / Red) as per Section 11.
- Compliance & audit KPIs:
 - number of audits passed,
 - open vs resolved recommendations,
 - successful compliance checks for new partners.

These KPIs make governance and risk transparent and accountable, rather than opaque.

13.3. Human Impact Index (HII) – Design & Use

The Human Impact Index (HII) is the core mission-level indicator.

It scores each mission on a 0–100 scale across a set of dimensions that together capture “peace per dollar” and “peace per community.”

13.3.1. Dimensions

Typical HII dimensions (refined over time):

1. Reach – How many people are meaningfully reached?
2. Depth of Change – How profound is the change for beneficiaries?
3. Sustainability & Resilience – How durable is the impact after funding stops?
4. Efficiency – How well are funds used (impact per dollar)?
5. Governance & Safeguards – Quality of local governance, transparency, inclusion, do-no-harm.
6. Verification & Evidence – Strength and reliability of evidence (docs, data, third-party verification).

Each dimension is scored 0–100, then aggregated (with weights) into the overall HII.

Weights can differ slightly by mission archetype, but weight choices and formulas are public.

13.3.2. Scoring Process

1. Baseline design

- During mission design, NGO and PS team define:
 - target outputs and outcomes,
 - KPIs for each HII dimension,
 - data sources and verification plan.

2. During execution

- NGOs submit periodic evidence (reports, surveys, photos, third-party attestations).
- Internal and/or external verifiers cross-check data where feasible.

3. Post-mission scoring

- At mission close, HII is computed:
 - NGO “self-score”,
 - independent scoring by Peace Soldiers staff or external reviewers,
 - reconciliation and documentation.

4. Follow-up scoring

- At 6–18 months, a follow-up review may adjust HII if new evidence emerges about sustainability and long-term outcomes.

HII outputs:

- Mission-level HII (0–100)
- Dimension breakdown (e.g., Reach 80, Depth 65, Sustainability 70...).
- Notes on context, caveats and qualitative insights.

This creates a comparable impact language across dozens or hundreds of missions.

13.3.3. Example HII Scoring (Illustrative)

Mission: “Rebuilding and equipping a community school in a post-conflict rural area”

- Reach:
 - 1,000 students + 50 teachers benefit directly → Score: 85/100
- Depth:
 - School reopens full-time, new curriculum modules on peace and conflict transformation → Score: 80/100
- Sustainability:
 - 3-year agreement with local education authority, teacher training and maintenance budget → Score: 75/100
- Efficiency:
 - Cost per student vs regional benchmarks is competitive → Score: 80/100
- Governance & Safeguards:
 - Inclusive school committee, transparent budget, community involvement → Score: 75/100
- Verification:
 - Site visits, photos, attendance records, interviews, external NGO partner review → Score: 90/100

Aggregated HII (weighted example):

- $HII = 0.2 \cdot \text{Reach} + 0.2 \cdot \text{Depth} + 0.2 \cdot \text{Sustainability} + 0.15 \cdot \text{Efficiency} + 0.15 \cdot \text{Governance} + 0.1 \cdot \text{Verification}$
- $HII \approx 0.2 \cdot 85 + 0.2 \cdot 80 + 0.2 \cdot 75 + 0.15 \cdot 80 + 0.15 \cdot 75 + 0.1 \cdot 90$
- $HII \approx 17 + 16 + 15 + 12 + 11.25 + 9 = 80.25 \approx 80/100$

This mission would be classified as “strong positive impact”, with clear, documented reasons.

13.4. Wealth Impact Ratio (WIR) – Linking Capital to People

The Wealth Impact Ratio (WIR) connects treasury performance to human outcomes.

It answers: “How much net wealth growth are we generating per person meaningfully impacted?”

Conceptually:

$$\text{WIR} = \text{Net Wealth Impact} / \text{People Impacted}$$

Where:

- Net Wealth Impact = change in Peace Soldiers’ “impact-adjusted wealth” over a period (e.g., treasury growth + net Store revenues – net capital inflows – inflation adjustment).
- People Impacted = total number of distinct beneficiaries meaningfully reached in that period, aggregated across missions (using HII-weighted counts if needed).

13.4.1. Example WIR Calculation (Illustrative)

Assume over one year:

- Starting treasury and reserves: \$30M
- Ending treasury and reserves: \$34M
- Net new capital raised (private + public + donations): \$2M
- Inflation / adjustment factor: \$1M (to preserve real value)

Then:

- Net Wealth Impact = $(34 - 30) - 2 - 1 = \$1\text{M}$

In the same period:

- Missions reached 20,000 unique people (after de-duplication),
- With an average HII of 80/100.

Option A – Simple WIR:

- $\text{WIR} = \$1,000,000 / 20,000 = \50 per person

Option B – HII-adjusted WIR (to reward higher-quality impact):

- $\text{Effective People Impact} = 20,000 \times (\text{HII} / 100) = 20,000 \times 0.8 = 16,000$
- $\text{WIR}(\text{HII}) = \$1,000,000 / 16,000 \approx \62.5 per HII-adjusted person

Over several years, WIR gives boards and investors a single, intuitive ratio:

- Higher WIR (all else equal) means the system is generating more capital per person impacted.
- Lower WIR may mean we are:
 - under-performing financially,
 - overextending operationally,
 - or deliberately prioritizing deeper impact per person in difficult contexts (which may be justified).

The goal is not to maximize WIR at all costs, but to keep it within a healthy, explained band that matches our mission and risk appetite.

13.5. From Metrics to Decisions

KPIs are useful only if they change behavior.

Peace Soldiers embeds KPIs and indices into:

1. Budgeting & treasury decisions

- HII and WIR feed into annual budget envelopes:
 - high HII + healthy WIR → justify mission budget growth,
 - weak HII or unsustainably low WIR → trigger reviews, reallocations, or slower scaling.

2. Mission & NGO portfolio management

- NGOs and missions with consistently high HII:
 - can graduate to higher-tier funding,
 - gain priority in co-funding and Peace Bonds.
- Missions with low or falling HII:
 - are reviewed in-depth,
 - may receive coaching or support,
 - or may be phased out if issues persist.

3. Ecosystem incentives

- \$PEACE rewards and Redistribution Pool allocations can be:
 - weighted by HII performance,
 - conditioned on proper reporting and verification.

4. Governance triggers

- KPI thresholds (e.g., coverage months, HII averages, WIR bands) tie into adaptive shields:
 - automatic or fast-track governance responses when metrics move into Amber/Red zones.

In this way, KPIs are not just dashboards; they are policy levers.

13.6. Data Infrastructure & Reporting

To make the KPI system work in practice, Peace Soldiers invests in data infrastructure:

- Mission & HII data pipeline
 - Standardized forms, APIs and templates for NGO reporting.
 - Validation and anomaly detection (e.g., sudden jumps in beneficiary numbers, duplicated reports).
- Treasury & financial data
 - On-chain indexers and off-chain accounting that reconcile positions, yields, fees and cash flows.
- User & ecosystem analytics
 - Funnel tracking, retention cohorts, governance participation stats.
- Dashboards & access levels
 - Internal dashboards for team and councils,

- Board dashboards for strategic oversight,
- Public dashboards (with appropriate aggregation/redaction) for community and external observers.

Reporting cadence:

- Quarterly KPI & Impact Reports
 - Combined HII summaries, mission stories, treasury KPIs, WIR, user stats.
- Annual Impact & Learning Report
 - Deeper analysis of:
 - which mission types and regions deliver most impact per dollar,
 - how HII and WIR evolved,
 - what will change in the next year based on these insights.

Wherever possible, numbers are backed by on-chain verifiable data, with clear reconciliation paths to off-chain evidence.

13.7. Iteration & Governance of Metrics

Finally, the KPI and measurement system itself is governed and upgraded like any other core module.

- HII & WIR governance
 - Changes to HII dimensions, weights or WIR methodology require:
 - proposal by NGO / Impact / Treasury councils,
 - community discussion,
 - PS-DAO approval and parameter registry update.
- Versioning
 - HII and WIR versions (e.g., HII v1.1, WIR v2.0) are clearly tagged in dashboards and reports, so analysts know which definitions applied when.
- External review
 - Periodic review of HII and KPI methodology by:

- external impact evaluation experts,
 - academic partners,
 - or industry peers in peace/impact measurement.
- Feedback loops
 - NGOs, beneficiaries and community members can propose metric changes or new indicators via governance channels.

The goal is to keep the measurement system:

- credible enough for boards, auditors and regulators,
- simple enough for NGOs and users,
- and flexible enough to adapt as Peace Soldiers learns what “effective peace per dollar” actually looks like in different contexts.

In summary, Section 13 ensures that Peace Soldiers is built as a measurable Peace Economy: with HII and WIR tying together missions, treasury and governance in a way that investors, NGOs and communities can all understand—and all hold each other accountable to.

14. Closing & Impact Statement

Peace Soldiers exists to answer a simple, uncomfortable question:

If the world can coordinate billions of dollars into memes and speculation in minutes, why can’t we coordinate the same energy into peace, dignity and basic human needs—in a way that is *transparent, sustainable and measurable*?

Everything in this Business Plan—

The MiniApp and Peace Passports, the mission engine and HII, the treasury-first architecture, the DAO, the Peace Store, the impact-aligned RWA layer, the KPI stack and adaptive shields—is a concrete, operational answer to that question.

We are not proposing another charity campaign or a one-off NFT drop.

We are proposing a neutral, programmable peace infrastructure:

- a system that can take capital from many sources,

- route it through a disciplined, audited treasury,
- and repeatedly turn it into HII-verified missions, stories and renewed capital.

If successful, Peace Soldiers becomes a global Peace Treasury:
a long-lived endowment where yield funds peace missions at scale, year after year.

14.1. What Success Looks Like

If Peace Soldiers succeeds, the world looks meaningfully different along four axes.

For people in fragile and underserved communities

- Funding for wells, clinics, schools, reconciliation programs and youth initiatives is not a one-off miracle,
but a steady pipeline supported by a global Peace Treasury.
- Local NGOs and social entrepreneurs spend less time chasing short-term grants and more time executing missions,
because they can plug into shared rails with transparent expectations and HII-based recognition.
- A young person in a conflict-adjacent region can say:
“This school, this mediation program, this water point exists because thousands of strangers funded it through Peace Soldiers—and I can see exactly how.”

For donors, users and communities worldwide

- Ordinary people can support a mission in under 60 seconds through the MiniApp—
and then follow real updates, photos, progress and HII scores, not just receive a generic thank-you email.
- Crypto-native users, DAOs and funds can allocate part of their portfolio to a transparent, rules-based Peace Treasury,
rather than building their own custom impact structures, due-diligence pipelines or reporting frameworks.
- Communities no longer need to choose between “*give to charity and never hear back*” and “*trade purely for profit*”.
They can participate in a Peace Economy where impact and disciplined capital are designed to reinforce each other.

For capital and investors

- Impact-oriented investors, family offices and ecosystem funds can treat Peace Soldiers as a structured, endowment-style impact allocation:
 - treasury composition and risk are clear,
 - WIR, HII and coverage metrics are tracked and reported,
 - and governance is identity-bounded, auditable and parameterized.
- The \$PEACE token is understood not as a hype instrument, but as a coordination asset with:
 - transparent supply and emission policies,
 - mission-linked demand and burn mechanics,
 - and real governance weight combined with reputation and identity.
- Over time, a PeaceFi vertical emerges—peace-focused capital markets built on top of PS rails—where RWA products, Peace Bonds and institutional mandates can plug into a trusted infrastructure instead of reinventing rails.

For NGOs, practitioners and the peace ecosystem

- Established NGOs can use Peace Soldiers as shared digital infrastructure:
 - standardized HII reporting,
 - mission funding rails,
 - and cross-NGO learning from pooled data and case studies.
- Smaller, high-quality local organizations gain access to capital and visibility that would otherwise be unreachable, because they can be “discovered” and funded through HII-verified performance and Peace Hubs.
- Policymakers, researchers and peacebuilders gain access to a global, anonymized data commons on what types of missions, in which contexts, deliver the best “peace per dollar” over time.

In that world, “peace projects” are no longer ad-hoc campaigns; they are a measurable asset class within a global Peace Economy.

14.2. Why Peace Soldiers Is Uniquely Positioned

There are already charities, NGOs, DAOs and ReFi experiments. Peace Soldiers is different because it unites five elements in a single architecture:

1. An existing NGO backbone with real history
 - Peace Soldiers is rooted in an NGO with a long-standing track record and six-figure membership base, not a whitepaper-only startup.
 - This provides immediate access to mission pipelines, local partners and field experience.
2. A treasury-first, endowment-style financial design
 - Capital is treated as a Peace Treasury, not a spend-down budget.
 - Missions are primarily funded from yield and ecosystem revenues, with principal preservation and clear risk limits.
 - WIR, coverage months and allocation caps make the model legible to institutional capital.
3. A mission engine with HII and structured data
 - Missions are not just funded; they are registered, monitored and scored via HII.
 - HII provides a common language across regions and themes, making peace work comparable and improvable.
4. A user-friendly front door and Peace Passports
 - The MiniApp and Peace Passports bridge Web2 and Web3, making it easy for everyday users to:
 - join,
 - support missions,
 - build a peace identity,
 - and gradually step into governance.
5. Governance that combines identity, expertise and capital
 - PS-DAO is not pure plutocracy: votes are bounded by identity and reputation.
 - Expert councils (Treasury, NGO, Security, Legal/Risk) provide professional stewardship.
 - Adaptive shields connect risk metrics to pre-defined policy responses, reducing emotional or ad-hoc decisions.

Individually, each of these elements exists elsewhere.

Peace Soldiers' advantage is that they are engineered to work together,
so that capital → rails → missions → data → trust → more capital becomes a repeatable cycle.

In short:

- NGOs bring legitimacy and proximity to communities,
- the protocol brings rails, capital discipline and data,
- the DAO brings distributed intelligence and accountability,
- and the Peace Treasury brings time horizon and financial resilience.

14.3. Invitation to Join the Peace Wealth Cycle

The Peace Soldiers thesis is simple:

Peace can be financed with the same seriousness and structure as any other critical asset—using on-chain transparency, endowment-style discipline and real-world safeguards—without losing the human stories at its core.

Joining this project as an investor, partner, or council member means:

- Helping to found a new vertical in Web3 and impact finance: a true Economy of Peace.
- Backing a model where capital, governance and technology are directly accountable to human outcomes, through HII, WIR and open reporting.
- Participating in a system designed to compound both wealth and dignity over decades, not quarters.

We are at a moment where:

- The need (for peace, stability and dignity) is obvious,
- the tools (blockchains, treasuries, data, AI, global mobile access) finally exist,
- but the bridge between them—between “capital at scale” and “verified peace impact”—is still missing.

Peace Soldiers is an attempt to build that bridge.

It is not guaranteed to succeed—no ambitious, systemic project is. But if it does, the return will be measured not only in multiples of treasury value, but in millions of lives touched by a new kind of global coordination.
